ELECTRON MICROSCOPY
Asbestos Fibers in Beverages, Drinking Water, and Tissues: Their Passage Through the Intestinal Wall and Movement Through the Body,
W73-14275 5A

ELECTRONIC EQUIPMENT
Practical Experience of the Water Resources Division in the Use of Multiparameter Electronic Recorders and Automated Techniques for Monitoring Water Quality in Streams,
W73-14323 5A

ELK RIVER (ORE.)
Elk River Salmon Hatchery Expansion,
W73-14519 8I

ELUTION CURVES
Experimental Study of Waterflood tracers,
W73-14727 2E

EMBRYONIC GROWTH STAGE
Effects of Reduced Oxygen Concentrations on Northern Pike (Esox lucius) Embryos and Larvae,
W73-14306 5C

ENERGY BUDGET
Energy Budget and Photosynthesis of Canopy Leaves,
W73-14358 2I

ENERGY DISSIPATION
Lateral Diffusion in a Tidal Estuary,
W73-14647 2L

ENGELMANN SPRUCE TREES
Comparative Evaluation of Thermal Profile Data of Healthy and Infested Englemann Spruce,
W73-14337 7B

ENGINEERING STRUCTURES
Puyallup Hatchery Pond and Pumping Plant Construction,
W73-14357 8I

ENRICHMENT
Deep-Sea Microorganisms: In Situ Response to Nutrient Enrichment,
W73-14446 5C

ENVIRONMENT
Resources for the Future, Annual Report, for the Year Ending September 30, 1972.
W73-14528 6B

ENVIRONMENTAL EFFECTS
Private Sector Reaction to Normal Political Institutional Procedures and Outcomes when Water is an Issue,
W73-14210 6E

Report on Half Moon Lake.
W73-14494 5G

U.S. Deepwater Port Study. Vol. 1. Summary and Conclusions,
W73-14524 6B

Study of Urban Effects on Precipitation at St. Louis,
W73-14539 2B

Environmental Effects of Hydraulic Dredging in Estuaries,
W73-14621 5C

Environmental Impact Requirements in the States,
W73-14749 5G

ENVIRONMENTAL IMPACT STATEMENTS
Environmental Impact Requirements in the States,
W73-14749 5G

ENVIRONMENTAL PROTECTION ACT
Environmental Impact Requirements in the States,
W73-14749 5G

ENVIRONMENTAL SAMPLES
Versatile Combustion-Amalgamation Technique for the Photometric Determination of Mercury in Fish and Environmental Samples,
W73-14271 5A

ENZYMES
Isolation and Properties of Ribonuclease-Deficient Mutant of Salmonella Typhimurium,
W73-14443 5A

EPIPHYTES
The Epiphytic Diatom Flora of the Benthic Macrophyte Communities on Rocky Shores in the Southwestern Archipelago of Finland, Seili Islands,
W73-14256 5A

EQUILIBRIUM
Basic Patterns in the Geologic Activity of Streams in Mountainous Areas (Osnovnyee zakonomernosti geologicheskoy deyatel'nosti rek gornykh stran),
W73-14603 2J

EQUITABLE APPORTIONMENT
Ontario's Water Taking Permit Program,
W73-14525 6E

EROSION
Evaluation of ERTS-1 Imagery for an Inventory of Post-1890 Accelerated Erosion,
W73-14329 7C

Experimental Study of Longshore Currents on a Plane Beach,
W73-14630 8B

Sea-Level Rise as a Cause of Shore Erosion,

Effects of Fishing and Hunting Expenditures on a Local Colorado Economy,
W73-14509 6B

Economic Evaluation of Sport Fisheries--What Do They Mean,
W73-14514 6B

FISHKILL
Biological Effects of Fenitrothion in the Diet of Brook Trout,
W73-14398 5C

FJORDS
A Numerical Model of a Fjord Estuary I Basic Considerations and Proposed Finite Difference Schemes,
W73-14619 2L

Oceanographic Surveys of Traitors Cove Revillagigedo Island, Alaska,
W73-14657 2L

FLAME PHOTOMETRY
Direct Vaporization and Quantification of Arsenic from Soils and Water,
W73-14416 5A

FLOOD CONTROL
Flood Plain Information, Clarksville, Tennessee.
W73-14238 4A

Flood Control Report, Casa Grande, Arizona, 1973.
W73-14476 4A

Flood Hazard Study.
W73-14491 6F

Water Resources of Middle Georgia.
W73-14499 6D

Obion and Forked Deer Rivers and Tributaries, Tennessee and Kentucky, Interim Report: Harris Fork Creek.
W73-14502 4A

FLOOD DATA
Flood Plain Information, Clarksville, Tennessee.
W73-14238 4A

FLOOD FLOW
Measurement of Flood Flow and Suspended Sedimentation by Radioisotope Method,
W73-14540 7B

FLOOD FORECASTING
Hydrologic Simulation.
W73-14685 4A

FLOOD MAPPING
Progress on Geologic-Terrain Mapping for Land-Use Planning in the Tucson Area,
W73-14348 7C

FLOOD PLAIN INSURANCE
Flood Insurance: A Report on Assistance to Flood Victims in Unincorporated Lake County, Illinois.
W73-14485 6F

Flood Hazard Study.
W73-14491 6F

FLOOD PLAIN MANAGEMENT
Flood Plain Information, Clarksville, Tennessee.
W73-14238 4A

Flood Insurance: A Report on Assistance to Flood Victims in Unincorporated Lake County, Illinois.
W73-14485 6F

Des Plaines River Valley: Goals, Policies, and Recommendations.
W73-14495 6F

Obion and Forked Deer Rivers and Tributaries, Tennessee and Kentucky, Interim Report: Harris Fork Creek.
W73-14502 4A

Hydrologic Simulation
W73-14685 4A

FLOOD PLAIN ZONING
Flood Hazard Study
W73-14491 6F

FLOOD PLAINS
Status of Flood-Plain Mapping, Greater Pittsburgh Region, Pennsylvania, 1972,
W73-14352 7C

Des Plaines River Valley Goals, Policies, and Recommendations
W73-14495 6F

Riverbanks Improvement Program. (Broome and Tioga Counties, N.Y.)
W73-14678 3D

FLOOD STAGES
Historic and June 1972 Flood Elevations, Greater Pittsburgh Region, Pennsylvania,
W73-14353 7C

FLOODING
Experimental Study of Waterflood tracers,
W73-14727 2E

A Study of Formation Plugging with Bacteria,
W73-14732 8E

FLOODS
Status of Flood-Plain Mapping, Greater Pittsburgh Region, Pennsylvania, 1972,
W73-14352 7C

Historic and June 1972 Flood Elevations, Greater Pittsburgh Region, Pennsylvania,
W73-14353 7C

FLORIDA
Shoreline Analysis of the City of Sarasota.
W73-14239 6B

Areawide Comprehensive Water-Sewer Plan, Part 2, Phase I, 1970-1995, Brevard County, Florida.

FRASER RIVER ESTUARY
Preliminary Survey of Mercury and Other Metals Contained in Animals From the Fraser River Mudelats,
W73-14293 5B

FREDERICK COUNTY (MARYLAND)
Report on Regional Wastewater Treatment Facilities for the Frederick Metropolitan Area, Frederick County, Maryland.
W73-14541 6A

FREE-ACCESS RESOURCES
Externalities, Factor Proportions and the Level of Exploitation of Free Access Resources,
W73-14507 6C

FREEZE DRYING
Retention of Mercury When Freeze-Drying Biological Materials,
W73-14272 5A

FREON
A Liquid Freon Permeameter,
W73-14706 8F

FREQUENCY
Factors Influencing the Frequency of Sampling,
W73-14324 5A

FREQUENCY ANALYSIS
Short Duration Rainfall Depth-Duration-Frequency Map of India,
W73-14555 2A

FRESHWATER
Is There Ample Freshwater on Earth, (Mnogo li presnoy vody na Zemle),
W73-14602 2A

FRESHWATER FISH
Effects of Pollution on Freshwater Fish,
W73-14259 5C

The Grand Traverse Bay Sport Fishery: Angler Activity, Revenue, and Economic Impact,
W73-14409 6B

FROZEN SOILS
Physical and Thermal Properties of Frozen Soil and Ice,
W73-14717 8D

FURROW IRRIGATION
A Mathematical Model of Water Advance and Flow in Small Earth Channels,
W73-14369 4A

GABION SILT TRAPS
Effect of Silt and Silt Removal In A Prairie Lake,
W73-14373 5C

GALVANIC CORROSION
Cathodic Protection Works,
W73-14713 8G

GAMMA RAYS
Coincidence and Interference Corrections for Dual-Energy Gamma Ray Measurements of Soil Density and Water Content,
W73-14424 2G

GAS CHROMATOGRAPHY
Quantitative Perchlorination of Polychlorinated Biphenyls as a Method for Confirmatory Residue Measurement and Identification.
W73-14276 5A

Polychlorinated Terphenyls as Potential Contaminants of Animal Products,
W73-14277 5A

Environmental Analysis Problems Created by Unexpected Volatile Beryllium Compounds in Various Samples,
W73-14299 2K

The Application of Gas Chromatography of Volatile Metal Chelates to Water Analysis,
W73-14393 2K

Simple Arrangement for the Detection of Sulphur in Gas-Chromatographic Eluates, (Einfache Anordnung Zum Nachiweis Von Schwefel in Gas-Chromatographischen Eluaten),
W73-14438 5A

GAS-LIQUID CHROMATOGRAPHY
Selected Pesticides in Aquatic Fungi in the Three Rivers Area,
W73-14207 5A

GEOCHEMISTRY
Simplest Organic Acids in Groundwater of the Lower Volga Region (Genesis and Possible use in Prospecting for Oil) (Nizshiye organicheskiye kisloty v podzemnykh vodakh Nizhnego Povolzh'ya (genesis i vozmozhnost' ispol'zovaniya v neftepoiskovykh tselyakh),
W73-14434 2K

GEOLOGIC MAPPING
Metallogenic Significance of Alaskan Geostructures Seen on Nimbus and ERTS Images,
W73-14331 7C

Progress on Geologic-Terrain Mapping for Land-Use Planning in the Tucson Area,

GEOLOGY
Basic Patterns in the Geologic Activity of Streams in Mountainous Areas (Osnovnyee zakonomernosti geologicheskoy deyatel'nosti rek gornykh stran),
W73-14603 2J

GEOPHYSICS
Concentration Ratios of Salts at the Sea Surface and in Rainwater Collected over the Sea (Sootnoshenive kontsentratsiy soley na poverkhnosti okeana i v morskoy atmosfernoy vlage),
W73-14435 2K

GEORGIA
Flood Hazard Study.
W73-14491 6F

Water Resources of Middle Georgia.
W73-14499 6D

GERMANY
On the Variability of Stephanodiscus hantzschii Grun., (Uber die Variabilitat von Stephanodiscus hantzschii Grun),
W73-14254 5A

The Testacea in the Area of Buschelbach Station (Bieber/Spessart, Germany), (Die Testaceen in der Umgebung der Station Buschelbach (Spessart/Brd)),
W73-14314 2I

GERMINATION
Western Wheatgrass Germination as Related to Temperature, Light, and Moisture Stress,
W73-14481 4A

GERMINATION (ANNUALPLANTS)
Germination Studies on Some Annual Species From an Arid Region of Western Australia,
W73-14738 2I

GLACIAL DRIFT
Glacier Pulsations and Problem of Predicting Them on the Medvezhiy Glacier (Pul'satsii lednikov i problema ikh prognozirovaniya na primere lednika Medvezh'yego (Zapadnyy Pamir)),
W73-14600 2C

GLACIATION
Date of Maximum Advance of the Last Glaciation Near Grodno (O vozraste maksimal'noy stadii poslednego oledeneniya v rayone Grodno),
W73-14436 2C

GLACIER SURGES
Glacier Pulsations and Problem of Predicting Them on the Medvezhiy Glacier (Pul'satsii lednikov i problema ikh prognozirovaniya na primere lednika Medvezh'yego (Zapadnyy Pamir)),
W73-14600 2C

GLACIERS
Study of Glaciers in Siberia and Soviet Far East During Years of Soviet Rule (Izuchenive lednikov v Sibiri i na Dal'nem Vostoke za gody Sovetskoy vlasti),
W73-14428 2C

Glacier Pulsations and Problem of Predicting Them on the Medvezhiy Glacier (Pul'satsii lednikov i problema ikh prognozirovaniya na primere lednika Medvezh'yego (Zapadnyy Pamir)),
W73-14600 2C

GLACIOLOGY
Study of Glaciers in Siberia and Soviet Far East During Years of Soviet Rule (Izuchenive lednikov v Sibiri i na Dal'nem Vostoke za gody Sovetskoy vlasti),
W73-14428 2C

GOVERNMENT STANDARDS
Water Quality Mangement Plan for Alameda Creek Watershed Above Niles.
W73-14237 5G

GOVERNMENTS
The Place of Local Authorities in the Management and Development of Water Resources,
W73-14230 6E

Optimum Government Investment in Supply Systems Yielding Uncertain Outputs,
W73-14463 5G

GRADED FURROWS
Runoff, Erosion, and Tillage Efficiency on Graded-Furrow and Terraced Watersheds,
W73-14410 4D

GRAND COUNTY (COLO.)
Effects of Fishing and Hunting Expenditures on a Local Colorado Economy,
W73-14509 6B

GRAND TRAVERSE BAY (MICH)
The Grand Traverse Bay Sport Fishery: Angler Activity, Revenue, and Economic Impact,
W73-14409 6B

GRANTS
The Nature of Chemistry in the National Sea Grant Program,
W73-14397 2K

GRANULES
Some Effects of Size Distribution on Particle Bridging in Lost Circulation and Filtration Tests,
W73-14726 8B

GRAVELS
Origin and Distribution of Sands and Gravels on the Northern Continental Shelf Off Washington,
W73-14584 2J

GRAVITY SURFACE WAVES
Refraction of Water Waves,
W73-14660 2L

GRAVITY WAVES
Refraction of Water Waves,
W73-14660 2L

GREAT LAKES
Coastal Ice Formation and its Effect on Beach Sedimentation,
W73-14573 2J

GREAT PLAINS
Chemical Composition of Six Southern Great Plains Grasses as Related to Season and Precipitation,
W73-14482 4A

GRODNO (USSR)
Date of Maximum Advance of the Last Glaciation Near Grodno (O vozraste maksimal'noy stadii poslednego oledeneniya v rayone Grodno),
W73-14436 2C

GROINS (STRUCTURES)
Effect of Particle Size and Distribution on Stability of Artificially Filled Beach Presque Isle Peninsula Pennsylvania,
W73-14664 2J

GROSS NATIONAL PRODUCT
Pollution in a Neo-Classical World.--The Classics Rehabilitated,
W73-14513 5G

GROUNDWATER
Optimal Identification of Aquifer Parameters in a Distribute System,
W73-14375 2F

Identification of Parameters in Finite Leaky Aquifer System,
W73-14376 2F

Simplest Organic Acids in Groundwater of the Lower Volga Region (Genesis and Possible use in Prospecting for Oil) (Nizshiye organicheskiye kisloty v podzemnykh vodakh Nizhnego Povolzh'ya (genesis i vozmozhnost' ispol'zovaniya v neftepoiskovykh tselyakh),
W73-14434 2K

Problems of Groundwater Use and Conservation in Lithuania (Voprosy ispol'zovaniya i okhrany podzemnykh vod Yuzhnoy Pribaltiki).
W73-14606 4B

Selected Bibliography on Laboratory and Field Methods in Ground Water Hydrology,
W73-14711 2F

The Horizontal Well as a New Method of Range Water Development,
W73-14729 8B

GROUNDWATER AVAILABILITY
Riverside's Ground Water Pumping System.
W73-14478 4B

GROUNDWATER EXPLORATION
Temperature Prospecting for Shallow Glacial and Alluvial Aquifers in Illinois,
W73-14714 4B

GROUNDWATER MOVEMENT
Determination of Some Hydrological Factors with a Well Recorder,
W73-14557 2A

Theoretical Analysis of the Role of Subsurface Flow in the Generation of Surface Runoff 2. Upstream source Areas,
W73-14608 2A

GROUNDWATER RATING CURVE METHOD
New Approaches to Water-Resources Investigations in Upstate New York,
W73-14709 2F

GROUNDWATER RECHARGE
Renovating Sewage Effluent by Groundwater Recharge,
W73-14225 5D

New Approaches to Water-Resources Investigations in Upstate New York,
W73-14709 2F

GROUNDWATER TABLE
Renovating Sewage Effluent by Groundwater Recharge,
W73-14225 5D

GROUTING
Strengthening Rock by Injection of Chemical Grout,
W73-14704 8G

GROWTH RATES
Isolation and Properties of Ribonuclease-Deficient Mutant of Salmonella Typhimurium,
W73-14443 5A

GUADALUPE RIVER (TEX)
Nitrogen and Phosphorus in a Stretch of the Guadalupe River, Texas, with Five Main-Stream Impoundments,
W73-14249 5B

GULF OF CALIFORNIA
Beach Cycles Related to Tide and Local Wind Wave Regime,
W73-14653 2J

GULFS
The Circulation of Prince William Sound,
W73-14588 2L

GULL LAKE (ALBERTA)
Gull Lake-Water Level Stabilization.
W73-14232 6E

HALF MOON LAKE (WISC)
Report on Half Moon Lake.
W73-14494 5G

HARBORS
U.S. Deepwater Port Study. Vol. 1. Summary and Conclusions,
W73-14524 6B

Louisiana Superport Studies--Report 2, Preliminary Assessment of the Environmental Impact of a Superport on the Southeastern Coastal Area of Louisiana,

LAND USE
A General Spatial Model: I. Application of Efficient Land Use,
W73-14257 4A

Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands.
W73-14326 7B

Monitoring the Effects of a Changing Resource Base in an Arid Lands Area: The West Side of the San Joaquin Valley, California,
W73-14345 7B

Geographic Investigations Associated with the Eros Program of the Department of the Interior,
W73-14346 7B

Automated Plotting and Update of Land Use Maps and Related Information in South Central Arizona,
W73-14347 7C

Remote Sensing of Irrigation Techniques and Crop Patterns in the Douglas Basin, Arizona,
W73-14350 7B

Pigeon Lake, Planning a Recreational Resource.
W73-14496 6B

Hydrologic Simulation.
W73-14685 4A

The Urban River: A Staff Proposal for Waterfront Development in the District of Columbia.
W73-14686 3D

LAND USE CONTROLS
Flood Insurance: A Report on Assistance to Flood Victims in Unincorporated Lake County, Illinois.
W73-14485 6F

LAND USE SUITABILITY
Study of the Cincinnati Riverfront - Part I: Regional Aspects.
W73-14681 6B

LASER-DOPPLER ANEMOMETER
Laser Doppler Velocity Measurements of Swirling Flows with Upstream Influence,
W73-14571 8B

LATERAL CONVEYANCE STRUCTURES
Flood Control Report, Casa Grande, Arizona, 1973.
W73-14476 4A

LEACHING
The Effect of Gradual Leaching on the Growth and Yield of Sugar Cane in Saline Soils,
W73-14473 3C

LEAD
Heavy Metals: A Review of Lead,
W73-14267 5B

Rapid, Selective Method for Lead BY Forced-Flow Liquid Chromatography,
W73-14295 5A

Isotachophoresis on Paper. Part II. The Separation of Ag (I), Tl (I), Hg2 (2 plus) and Pb (II),
W73-14449 5A

The Effects of Pollution Control on the Nonferrous Metals Industries: Lead. Part II. Structure of the Industry.
W73-14517 5G

LEAD INDUSTRY
The Effects of Pollution Control on the Nonferrous Metals Industries: Lead. Part I. Introduction and Executive Summary.
W73-14516 5G

LEAKAGE
Identification of Parameters in Finite Leaky Aquifer System,
W73-14376 2F

LEAVES
Energy Budget and Photosynthesis of Canopy Leaves,
W73-14358 2I

Ecological Response of the Australian Native Species Acacia Harpophylla and a Triplex Nummularia to Soil Salinity: Effects on Water Content, Leaf Area, and Transpiration Rate,
W73-14472 3C

Stomatal Resistance During Senescence of Hardwood Leaves,
W73-14543 2I

LEISURE
Sociological Dimensions of Leisure Involvement in Water-Based Recreation,
W73-14211 6B

LEMON TREES
Effects of Water Stress, Gibberellic Acid and 2-Chloroethyltrimethylammoniumchloride (CCC) on Flower Differentiation in 'Eureka' Lemon Trees,
W73-14737 2I

LIGHT
Western Wheatgrass Germination as Related to Temperature, Light, and Moisture Stress,
W73-14481 4A

LIGHT EMISSION
A Photon Counting Device for the Measurement of Nanosecond and Microsecond Kinetics of Light Emission from Biological Systems,
W73-14453 5A

LIGHT PENETRATION
Inexpensive Dual Beam Turbidimeter,
W73-14575 2J

LIMESTONES
A Study of Formation Plugging with Bacteria,
W73-14732 8E

LIMITING FACTORS
Pollution in a Neo-Classical World.--The Classics Rehabilitated,
W73-14513 5G

LIMNOLOGY
Some Limnological Characteristics of the Nozha Hydrodrome, Near Alexandria, Egypt,
W73-14252 5A

Dynamics of Playa Lakes in the Texas High Plains,
W73-14356 7B

LINEAR PROGRAMMING
Flow Regulation for Water Quality Management,
W73-14466 5G

LIQUID CHROMATOGRAPHY
Determination of Trace Phenol in Aqueous Solution by Aqueous Liquid Chromatography,
W73-14303 5A

LIQUID SCINTILLATION SPECTROSCOPY
The Analysis of Tritium Oxide from Selected Areas of the Connecticut River,
W73-14362 5A

LITHUANIA SSR
Problems of Groundwater Use and Conservation in Lithuania (Voprosy ispol'zovaniya i okhrany podzemnykh vod Yuzhnoy Pribaltiki).
W73-14606 4B

LITTLE PORT WALTER (ALAS)
Some Aspects of the Oceanography of Little Port Walter Estuary, Baranof Island, Alaska,
W73-14665 2L

LITTORAL DRIFT
An Introduction to Coastal Morphology and Littoral Processes,
W73-14629 2J

Coastal Processes and Beach Erosion,
W73-14633 2J

Sea-Level Rise as a Cause of Shore Erosion,
W73-14638 2J

A Case Study of Littoral Drift Based on Long-Term Patterns of Erosion and Deposition,
W73-14641 2L

Physiographical Conditions of the Formation of the Seacoast Ore Fields, (Fiziko-Geograficheskiye Usloviya Nakopleniya Rossypey Pribrezhno-Morskogo Genezisa),
W73-14655 2J

LITTORAL SAND DRIFT
Wave Measurements off Oxnard, California,
W73-14625 8B

LIVESTOCK
Canada Animal Waste Management Guide.
W73-14392 5G

LLANO ESTACADO (TEX)
Chemical Composition of Six Southern Great Plains Grasses as Related to Season and Precipitation,
W73-14482 4A

LONG ISLAND SOUND (NY)
Estuarine and Coastal Water Dynamics Controlling Sediment Movement and Plume Development in Long Island Sound,
W73-14590 2L

LONG-TERM PLANNING
Resources for the Future, Annual Report, for the Year Ending September 30, 1972.
W73-14528 6B

LONGSHORE BAR FORMATION
Coastal Movable-Bed Scale-Model Relationship,
W73-14622 2J

LONGSHORE CURRENTS
Experimental Study of Longshore Currents on a Plane Beach,
W73-14630 8B

Rip Currents. 2. Laboratory and Field Observations,
W73-14636 2E

LOUISIANA
Reduction and Evaluation of Biological Data,
W73-14310 5A

Louisiana Superport Studies--Report 2, Preliminary Assessment of the Environmental Impact

of a Superport on the Southeastern Coastal Area of Louisiana,
W73-14592 5B

LOWER FRASER RIVER (B.C.)
A Preliminary Baseline Study of Roberts and Sturgeon Banks,
W73-14486 5A

A Preliminary Water Quality Survey of the Lower Fraser River System,
W73-14487 5A

LUBBOCK (TEX)
Report on Makeup Water for the Upper Canyon Lakes, Lubbock, Texas.
W73-14236 5G

LYSIMETERS
Description of Water-Salt Relations of Some Soils in Central Ciscaucasia From Lysimeter Experimental Data (Kharakteristika vodno-solevogo rezhima nekotorykh pochv Tsentral'-nogo Predkavkaz'ya po dannym lizimetricheskikh opytov),
W73-14605 2G

MACROPHYTES
The Epiphytic Diatom Flora of the Benthic Macrophyte Communities on Rocky Shores in the Southwestern Archipelago of Finland, Seili Islands,
W73-14256 5A

MAGNESIUM
Application of Oxine in the Polarographic Analysis of Organometallic Compounds. Microdetermination of Cadmium, Magnesium, Zinc, Manganese, and Cobalt,
W73-14244 5A

MALIBU WATERSHED (CALIF)
The Computer-Systems Approach to Environmental Protection, Planning and Management: The Malibu Watershed,
W73-14371 5B

MANAGEMENT
A Study of Managerial Practices in Rural Water Systems,
W73-14208 6B

Proceedings - Sixteenth Annual Water Conference.
W73-14224 4A

Canada Animal Waste Management Guide.
W73-14392 5G

Conceptual Model of a Regional Water Quality Authority,
W73-14459 5G

An Illustrative Model of River Basin Pollution Control,
W73-14460 5G

Optimum Government Investment in Supply Systems Yielding Uncertain Outputs,
W73-14463 5G

Flow Regulation for Water Quality Management,
W73-14466 5G

Water Resources of Middle Georgia.
W73-14499 6D

The Socio-Economic Dimension of Water Management,
W73-14506 6A

Optimal Policy for Reservoir Management,
W73-14666 4A

Constraints and Strategic Choices in Water Supply Investment,
W73-14671 6A

A Systems Approach to Solid Waste Management in Asia Bangkok, Thailand, As a Case Study,
W73-14674 5D

MANAGEMENT PLANNING
Guide to the Preparation of Operational Plans for Sewage Treatment Facilities,
W73-14214 5D

MANGANESE
Application of Oxine in the Polarographic Analysis of Organometallic Compounds Microdetermination of Cadmium, Magnesium, Zinc, Manganese, and Cobalt,
W73-14244 5A

MANGEMENT
Models for Managing Regional Water Quality,
W73-14457 5G

MAPPING
Production of Thematic Maps by Optical Analog Processing of Color Transparencies,
W73-14339 7B

Automated Plotting and Update of Land Use Maps and Related Information in South Central Arizona,
W73-14347 7C

Status of Flood-Plain Mapping, Greater Pittsburgh Region, Pennsylvania, 1972,
W73-14352 7C

MARINE ALGAE
The Epiphytic Diatom Flora of the Benthic Macrophyte Communities on Rocky Shores in the Southwestern Archipelago of Finland, Seili Islands,
W73-14256 5A

Examination of Ultrastructure and Growth of the Cell Wall of Spyridia Filamentosa (Wulf.) Harv., Untersuchungen Uber Bau und Wachstum Der Zellwande Von Spyridia Filamentosa (Wulf.) Harv.),
W73-14439 5C

MARINE ENVIRONMENT
Marine and Estuarine Pollution,
W73-14266 5B

MARINE MICROORGANISMS
Deep-Sea Microorganisms: In Situ Response to Nutrient Enrichment,
W73-14446 5C

MARITIME TERRITORY (USSR)
Hydrologic Regime of Coniferous Broad-Leaved Forest Trees in the Southern Maritime Territory (Gidrologicheskiy rezhim khvoyno-shirokolistvennykh lesov yuzhnogo Primor'ya),
W73-14432 2I

MASS SPECTROMETRY
Liquid Chromatography-Mass Spectrometry. Coupling of a Liquid Chromatograph to a Mass Spectrometer,
W73-14274 5A

Analysis of Organic Salts by Laser Ionization Mass Spectrometry: Sufonates, Sulfates and Thiosulfates,
W73-14546 5A

MASS TRANSFER COEFFICIENTS
New Method for Evaluation of Dissolved Oxygen Probe Response for K sub L a Determination.
W73-14452 5A

MASSACHUSETTS
Riverfront Development Plan Connecticut River, Springfield, Massachusetts
W73-14676 3D

MATHEMATICAL MODELS
Predicting and Controlling Residual Chlorine in Cooling Tower Blowdown,
W73-14215 5D

A Mathematical Model of Water Advance and Flow in Small Earth Channels,
W73-14369 4A

Models for Managing Regional Water Quality,
W73-14457 5G

Waste Disposal in Natural Waterways,
W73-14458 5G

Conceptual Model of a Regional Water Quality Authority,
W73-14459 5G

An Illustrative Model of River Basin Pollution Control,
W73-14460 5G

Municipal Evaluation of Regional Water Quality Management Proposals,
W73-14461 5G

Experience with a Monthly Rainfall-Runoff Transfer Function Model,
W73-14560 2A

The Use of EVOP as a Hydrologic Tool,
W73-14561 2A

On The Use of Short-Term Data for Streamflow Synthesis,
W73-14563 2A

A Numerical Model of a Fjord Estuary. I. Basic Considerations and Proposed Finite Difference Schemes,
W73-14619 2L

The Two-Dimensional Flow Oscillations of a Fluid in a Spindle-Shaped Basin: Application to Port Kembla Outer Harbour, N.S.W., Australia,
W73-14624 2L

Investment Criteria and Mathematical Modelling Techniques for Water Resources Planning in Argentina: The MIT-Argentina Project,
W73-14670 6A

Modelling Techniques for a System Engineering Approach of the Problems of Water Uses for Agricultural Purposes,
W73-14673 8B

MATHEMATICAL STUDIES
Reduction and Evaluation of Biological Data,
W73-14310 5A

MAYFLIES
The Mayfly (Ephemeroptera) in Trout Streams of the Beskids. II. Production, Die Eintagsfliegen (Ephemeropta) in Forellenbachen Der Beskiden. II. Produktion),
W73-14292 5A

MEASUREMENT
Some Instruments Available now for the Measurement of Wastewater Parameters,
W73-14321 5A

Measurement of Organic Wastewater Parameters,
W73-14322 5A

Inexpensive Dual Beam Turbidimeter,
W73-14575 2J

A Circuit for a Self-Timing Stomatal Diffusion Porometer,
W73-14747 2I

MEDIAN TOLERANCE LIMIT
Concerning the Influence of Herbicides on Several Freshwater Animals, Uber Den Einfluss Der Herbizide Auf Einige Susswassertiere,
W73-14437 5C

MEDVEZHIY GLACIER
Glacier Pulsations and Problem of Predicting Them on the Medvezhiy Glacier (Pul'satsii lednikov i problema ikh prognozirovaniya na primere lednika Medvezh'yego (Zapadnyy Pamir)),
W73-14600 2C

MEMBRANE ELECTRODES
Role of Solvent Extraction Parameters in Governing the Potential Selectivity of Liquid Membrane Electrodes,
W73-14297 2K

Preparation and Properties of the Sulfate Ion Selective Membrane Electrode,
W73-14301 2K

MEMBRANE PROCESSES
Preparation of Hollow Fibers and the Evaluation of Their Properties,
W73-14379 3A

MEMBRANES
Application of Fluidized Bed for Controlling the Concentration Polarization Boundary Layer in Reverse Osmosis Desalination Systems,
W73-14377 3A

The Effects of Porous and Solid Fillers on the Permeability of Cellulose Acetate Membranes,
W73-14378 3A

Research and Development of Composite Membrane Technology,
W73-14382 3A

Hyperfiltration in Polyelectrolyte Membranes,
W73-14383 3A

Research and Development of New and Improved Cellulose Ester Membranes,
W73-14384 3A

Research on Improved Reverse Osmosis Membranes,
W73-14386 3A

MERCURY
Versatile Combustion-Amalgamation Technique for the Photometric Determination of Mercury in Fish and Environmental Samples,
W73-14271 5A

Retention of Mercury When Freeze-Drying Biological Materials,
W73-14272 5A

Preliminary Survey of Mercury and Other Metals Contained in Animals From the Fraser River Mudelats,
W73-14293 5B

The Fluorimetric Determination of Mercury,
W73-14442 5A

Isotachophoresis on Paper. Part II. The Separation of Ag (I), Tl (I), Hg2 (2 plus) and Pb (II),
W73-14449 5A

Radiochemical Studies on Effect of Bath: I. Determination of Mercury in Spring Mud by Neutron Activation Analysis (In Japanese),
W73-14661 5A

MERCURY (METAL)
Sacrificial Electrode System for Removal of Heavy Metal Ions from Waste Water,
W73-14693 5D

MERSEY ESTUARY (U.K.)
Circulation, Salinity and River Discharge in the Mersey Estuary,
W73-14658 2L

METABOLISM
The Metabolism of Long-Chain Fatty Acids and Alcohols by Candida Tropicalis and Saccharomyces Cerevisiae,
W73-14325 5C

Stress Metabolism. II: Changes in Proline Concentration in Excised Plant Tissues,
W73-14503 3F

Stress Metabolism. IV: The Influence of (2-Chloroethyl) Trimethylammonium Chloride and Gibberellic Acid on the Growth and Proline Accumulation of Wheat Plants During Water Stress,
W73-14505 3F

Stress Metabolism. III: Variations in Response to Water Deficit in the Barley Plant,
W73-14506 3F

METAL CHELATES
The Application of Gas Chromatography of Volatile Metal Chelates to Water Analysis,
W73-14393 2K

METAL COMPLEXES
Separation of Molybdenum From Tungsten, Vanadium, Iron, Uranium and Several Other Interfering Elements by Extraction of Its Thiosulphato Complex,
W73-14246 5A

METAL-THIOSULPHATO COMPLEXES
Separation of Molybdenum From Tungsten, Vanadium, Iron, Uranium and Several Other Interfering Elements by Extraction of Its Thiosulphato Complex,
W73-14246 5A

METEOROLOGY
Hydrometeorological Investigations in Kazakhstan (Gidrometeorologicheskiye issledovaniya v Kazakhstane).
W73-14433 2B

METHODOLOGY
Micro and Semimicro Determination of Arsenate Using Ion-Selective Electrodes,
W73-14250 5A

Versatile Combustion-Amalgamation Technique for the Photometric Determination of Mercury in Fish and Environmental Samples,
W73-14271 5A

Modifications of the Technique for Differentiating Cultures Isolated by the Official AOAC Salmonella Method,
W73-14278 5A

A Rapid, Sensitive Method for the Determination of the Chemical Oxygen Demand of Polluted Waters,
W73-14283 5A

Atomic Absorption Analysis of Strong Heavy Metal Chelating Agents in Water and Waste Water,
W73-14287 5A

Water Quality Monitoring on the Mississippi River Has Its Pitfalls,
W73-14320 5B

New Method for Evaluation of Dissolved Oxygen Probe Response for K sub L a Determination,
W73-14452 5A

Selected Bibliography on Laboratory and Field Methods in Ground Water Hydrology,
W73-14711 2F

MICHIGAN
Selected Pesticides in Aquatic Fungi in the Three Rivers Area,
W73-14207 5A

The Grand Traverse Bay Sport Fishery: Angler Activity, Revenue, and Economic Impact,
W73-14409 6B

MICROBIAL DEGRADATION
Microbiology of Waste Treatment,
W73-14261 5D

Deep-Sea Microorganisms: In Situ Response to Nutrient Enrichment,
W73-14446 5C

MICROBIOLOGY
Microbiology of Waste Treatment,
W73-14261 5D

Microbiology-Detection of Bacterial Pathogens and Their Occurrence,
W73-14263 5A

Microbiology-Detection and Occurrence of Viruses,

Experimental Data for Substantiating the Residual Concentrations of Chlorine Dioxide in Drinking Water, (In Russian),
W73-14707 5C

A Potable Water Dispenser, (Patent application, NASA Case MFS-21115-1),
W73-14734 5F

A Fluid Dispenser, (Patent application, NASA-Case-MFS-21163-1),
W73-14735 5F

POULTRY
Collaborative Study of the Recovery and Gas Chromatographic Quantitation of Polychlorinated Biphenyls in Chicken Fat and Polychlorinated Biphenyl-DDT Combinations in Fish,
W73-14273 5A

PRE-IMPOUNDMENT
An Annotated List of Fishes From the Upper Salt River, Kentucky,
W73-14544 2I

PRE-TREATMENT (WATER)
Reverse Osmosis for Wash Water Recovery,
W73-14387 5D

PRECIPITATION (ATMOSPHERIC)
Hydrometeorological Investigations in Kazakhstan (Gidrometeorologicheskiye issledovaniya v Kazakhstane).
W73-14433 2B

PRECIPITATION (ATMOSPHERIC)

Chemical Composition of Six Southern Great Plains Grasses as Related to Season and Precipitation,
W73-14482 4A

PRECISION
Estimating Precision for the Method of Standard Additions,
W73-14305 2K

PRESERVATION
Shoreline Analysis of the City of Sarasota.
W73-14239 6B

PRESQUE ISLE PENINSULA (PENN)
Effect of Particle Size and Distribution on Stability of Artificially Filled Beach Presque Isle Peninsula Pennsylvania,
W73-14664 2J

PRESSURE
Effect of Anisotropy and Stratification on Pressure Transient Analysis of Wells with Restricted Flow Entry,
W73-14710 8B

Effect of Overburden Pressure on Some Properties of Sandstones,
W73-14724 8E

PRESSURE FILTRATION
Pressure Filtration of Waste Water Sludge With Ash Filter Aid,
W73-14374 5D

PRESSURE TRANSIENT ANALYSIS
Pressure Transient Analysis of Naturally Fractured Reservoirs with Uniform Fracture Distribution,
W73-14708 8B

PRICING
Future Allocations of Land and Water: Implications for Agricultural and Water Policies,
W73-14521 6D

PRIMARY PRODUCTIVITY
Relationship Between Extracellular and Cellular Production in the Sulphuric Green Bacterium Chlorobium limicola Nads. (Chlorobacteriaceae) as Compared to Primary Production of Phytoplankton,
W73-14245 5C

Summer Algal Communities and Primary Productivity in Fish Ponds,
W73-14315 5C

Effects of Artificial Destratification on Primary Production and Zoobenthos of El Capitan Reservoir, California,
W73-14444 5C

PRINCE EDWARD ISLAND
Salt-Water Intrusion in Prince Edward Island,
W73-14645 2L

PRINCE WILLIAM SOUND REGION (ALASKA)
The Circulation of Prince William Sound,
W73-14588 2L

PROBABILITY
Machine-Plotted Probability Charts,
W73-14282 7C

Analysis of Monthly Rainfall Probabilities by Weighted Transformation,
W73-14565 2A

PRODUCTION
Canada Animal Waste Management Guide.
W73-14392 5G

Production, Pollution, Protection,
W73-14430 5B

PRODUCTIVITY
Snow Amount in Relation to Streamflow and Herbage Production in Western Colorado,
W73-14479 3B

The Biomass, Productivity, and Phytogeochemistry of the Vegetation of the Banks of a Stream in Ardenne (The Gembes Stream at Daverdisse, Luxembourgian Part of the Ardenne Region): II. Phytogeochemical Survey, (In French),
W73-14596 2I

PROFIT
Optimal Policy for Reservoir Management,
W73-14666 4A

PROJECT BENEFITS
Cluster Analysis and Water Project Evaluation,
W73-14510 6B

PROJECT PLANNING
Optimization of Water Resource Systems Incorporating Earthquake Risk: 1973 Contributions,
W73-14204 6A

Flood Control Report, Casa Grande, Arizona, 1973.
W73-14476 4A

Design for Future Program Construction,
W73-14522 8I

PROJECTS
Inventory of Water Resources Conducted In Minnesota 1963 through 1972,
W73-14366 9D

PROTEINS
Proteins in Wastewater and Wastewater Sludges,
W73-14311 5A

PROTEUS
Abolition of Swarming of Proteus by p-Nitrophenyl Glycerin: Application to Blood Agar Media,
W73-14456 5A

PROTOZOA
The Environmental Toxicity of Crassin Acetate Using Tetrahymena pyriformis as a Model,
W73-14255 5C

Proteins in Wastewater and Wastewater Sludges,
W73-14311 5A

The Testacea in the Area of Buschelbach Station (Bieber/Spessart, Germany), (Die Testaceen in der Umgebung der Station Buschelbach (Spessart/Brd)),
W73-14314 2I

PROVENANCE
Composition of Sand Released from Three Source Areas Under Humid, Low Relief Weathering in the North Carolina Piedmont,
W73-14577 2J

Origin and Distribution of Sands and Gravels on the Northern Continental Shelf Off Washington,
W73-14584 2J

PUBLIC HEALTH
Microbiology-Detection and Occurrence of Viruses,
W73-14264 5A

PUBLIC LANDS
Implications of Pilrc Tax Recommendations for Federal Hydro Projects and Power Facilities
W73-14512 6E

PULP WASTES
Effect of Waste Water from the Astrakhan' Cellulose and Pasteboard Combine on Soil Properties (Vliyaniye stochnykh vod Astrakhanskogo tsellyulozno-kartonnogo kombinata na svoystva pochv),
W73-14601 5D

PULSED ADSORPTION BEDS
A Pilot Plant Investigation of the Pulsed Adsorption Bed Process,
W73-14389 5D

PUMPED STORAGE
Riverside's Ground Water Pumping System
W73-14478 4B

PUMPING
Riverside's Ground Water Pumping System.
W73-14478 4B

PUYALLUP SALMON HATCHERY (WASH)
Puyallup Hatchery Pond and Pumping Plant Construction,
W73-14357 8I

QUANTITATIVE ANALYSIS
Quantitative Perchlorination of Polychlorinated Biphenyls as a Method for Confirmatory Residue Measurement and Identification.
W73-14276 5A

QU'APPELLE RIVER BASIN
Future Municipal and Industrial Water Requirements in the Qu'appelle River Basin.
W73-14231 6D

QUASILINEARIZATION
Optimal Identification of Aquifer Parameters in a Distribute System,
W73-14375 2F

RADAR
Basic Considerations of High Resolution Side-Looking Radar Imagery,
W73-14332 7B

The Application of Radar and Infrared Imagery to Quantitative Geomorphological Problems,
W73-14333 7B

RADIATION
Freshwater Macroinvertebrates,
W73-14270 5C

Energy Budget and Photosynthesis of Canopy Leaves,
W73-14358 2I

RADIOACTIVE DATING
Date of Maximum Advance of the Last Glaciation Near Grodno (O vozraste maksimal'noy stadii poslednego oledeneniya v rayone Grodno),
W73-14436 2C

RADIOACTIVE WASTE DISPOSAL
Ultimate Management of Radioactive Liquid Wastes,
W73-14390 5G

RADIOACTIVE WASTES
Uptake of Radionuclides by Some Aquatic Macrophytes of Ismailia Canal, Egypt,
W73-14247 5C

RADIOACTIVITY
A Selected Annotated Bibliography on Water Resources of the State of Washington.
W73-14201 2E

A Selected Annotated Bibliography on Columbia and Snake Rivers.
W73-14202 2E

RADIOACTIVITY TECHNIQUES
Retention of Mercury When Freeze-Drying Biological Materials,
W73-14272 5A

RAIN
Asbestos Fibers in Beverages, Drinking Water, and Tissues: Their Passage Through the Intestinal Wall and Movement Through the Body,
W73-14275 5A

RAIN WATER
Concentration Ratios of Salts at the Sea Surface and in Rainwater Collected over the Sea (Sootnoshenive kontsentratsiy soley na poverkhnosti okeana i v morskoy atmosfernoy vlage),
W73-14435 2K

RAINBOW TROUT
Biological Effects of Cooling Tower Blowdown,
W73-14285 5C

Molybdenum Concentrations in Tissues of Rainbow Trout (Salmo gairdneri) and Kokanee Salmon (Oncorhynchus nerka) from Waters Differing Widely in Molybdenum Content,
W73-14309 5B

RAINFALL
A Similar Storm Method on Filling Data Voids,
W73-14564 2A

Analysis of Monthly Rainfall Probabilities by Weighted Transformation,
W73-14565 2A

RAINFALL-RUNOFF RELATIONSHIPS
Master Plan for Storm Drainage: Fort Wayne-New Haven-Allen County Metropolitan Area.
W73-14500 6B

Computations of Peak Floods with Inadequate Hydrologic Data,
W73-14556 2A

Concept of a Technique for an Analysis of Watershed Runoff Events,
W73-14559 2A

Experience with a Monthly Rainfall-Runoff Transfer Function Model,
W73-14560 2A

On The Use of Short-Term Data for Streamflow Synthesis,
W73-14563 2A

Theoretical Analysis of the Role of Subsurface Flow in the Generation of Surface Runoff: 2. Upstream source Areas,
W73-14608 2A

RAINFALL SIMULATORS
Pollution from Animal Feedlots,
W73-14227 5B

RANGE GRASSES
Some Factors Influencing Tolerance to Moisture Stress of three Range Grasses,
W73-14475 4A

Chemical Composition of Six Southern Great Plains Grasses as Related to Season and Precipitation,
W73-14482 4A

RECLAIMED WATER
Report on Makeup Water for the Upper Canyon Lakes, Lubbock, Texas.
W73-14236 5G

RECOLONIZATION (FISH)
Recolonization of a Rotenone-Treated Segment of the Ten Mile River,
W73-14742 8I

RECORDERS
Practical Experience of the Water Resources Division in the Use of Multiparameter Electronic Recorders and Automated Techniques for Monitoring Water Quality in Streams,
W73-14323 5A

RECREATION
Report on Half Moon Lake.
W73-14494 5G

Des Plaines River Valley: Goals, Policies, and Recommendations.
W73-14495 6F

Effects of Fishing and Hunting Expenditures on a Local Colorado Economy,
W73-14509 6B

Economic Evaluation of Sport Fisheries--What Do They Mean,
W73-14514 6B

Riverfront Development Plan, Connecticut River, Springfield, Massachusetts.
W73-14676 3D

Riverbanks Improvement Program, (Broome and Tioga Counties, N.Y.).

Physical and Thermal Properties of Frozen Soil and Ice,
W73-14717 8D

Rock Stresses Induced by Flow of Fluids into Boreholes,
W73-14725 8E

SHEET EROSION
Longitudinal Ripples Formed by Overland Flow and Tidal Currents,
W73-14585 2J

SHELLFISH
Microbiology-Detection and Occurrence of Viruses,
W73-14264 5A

SHINERS
Toxicity Assessment of Treated Municipal Wastewaters,
W73-14258 5C

SHIPS
U.S. Deepwater Port Study. Vol. 1. Summary and Conclusions,
W73-14524 6B

Environmental Protection: New Navy Duty,
W73-14689 5D

SHOALING PROCESSES
Flume Studies of the Transport of Sediment in Estuarial Shoaling Processes,
W73-14623 2L

SHORE PROTECTION
Coastal Processes and Beach Erosion,
W73-14633 2J

SHORELINE MAINTENANCE
Report on Half Moon Lake.
W73-14494 5G

SHORELINES
Shoreline Analysis of the City of Sarasota.
W73-14239 6B

SHRIMP
Effect of Fish Removal on the Growth and Condition of White Shrimp, Penaeus Setiferous (Linnaeus), in Brackish Ponds,
W73-14587 2L

SIBERIA
Study of Glaciers in Siberia and Soviet Far East During Years of Soviet Rule (Izuchenive lednikov v Sibiri i na Dal'nem Vostoke za gody Sovetskoy vlasti),
W73-14428 2C

SIDE-LOOKING RADAR
Basic Considerations of High Resolution Side-Looking Radar Imagery,
W73-14332 7B

SILAGE
Polychlorinated Terphenyls as Potential Contaminants of Animal Products,
W73-14277 5A

SILICATES
Atomic Absorption Analysis of Phosphates in Water,
W73-14223 5A

SILTS
Effect of Silt and Silt Removal In A Prairie Lake,
W73-14373 5C

SILVER
Isotachophoresis on Paper. Part II. The Separation of Ag (I), Tl (I), Hg2 (2 plus) and Pb (II),
W73-14449 5A

SIMULATION ANALYSIS
A Simulation Technique of Monthly Runoff by Use of Precipitation Time Series at Multistations,
W73-14562 2A

Modelling Techniques for a System Engineering Approach of the Problems of Water Uses for Agricultural Purposes,
W73-14673 8B

Hydrologic Simulation.
W73-14685 4A

SINKS
Aquatic Sediments,
W73-14265 5C

Sources and Sinks of Nitrogen and Phosphorus: Water Quality Management of Lake George (N.Y),
W73-14284 5B

SITE CONDITIONS
Effects of Trees and Forests in Neutralizing Waste,
W73-14610 5D

SITE INDEX
Prediction of Site Index of Lodgepole Pine From Selected Environmental Factors,
W73-14740 2I

SITES
Water for the Future,
W73-14520 6B

SKIMMING
Method and Apparatus for Removal of Surface Liquids,
W73-14692 5G

SLIME
Phosphorus Removal by Trickling Filter Slimes,
W73-14372 5D

SLOPE METHOD
New Method for Evaluation of Dissolved Oxygen Probe Response for K sub L a Determination,
W73-14452 5A

SLUDGE DIGESTION
Sludge Processing for Combined Physical-Chemical-Biological Sludges,
W73-14218 5D

SLUDGE DISPOSAL
Sludge Processing for Combined Physical-Chemical-Biological Sludges,
W73-14218 5D

Sewage Effluent and Sludge Make Possible Revegetation of Strip Mine Spoil Banks,
W73-14611 5E

Revegetation of Strip Mine Spoil Banks with Sewage Effluent and Sludge,
W73-14613 5E

SLUDGE TREATMENT
Sludge Processing for Combined Physical-Chemical-Biological Sludges,
W73-14218 5D

Pressure Filtration of Waste Water Sludge With Ash Filter Aid,
W73-14374 5D

Sludge Separation Systems Employing Refrigeration Means,
W73-14697 5D

SLURRIES
Displacement Mechanics in Primary Cementing,
W73-14703 8F

Rheological Design of Cementing Operations,
W73-14705 8F

SLURRY DISPLACEMENT
Displacement Mechanics in Primary Cementing,
W73-14703 8F

SMALL WATERSHEDS
The Application of Radar and Infrared Imagery to Quantitative Geomorphological Problems,
W73-14333 7B

SNAKE RIVER
A Selected Annotated Bibliography on Columbia and Snake Rivers.
W73-14202 2E

SNOWMELT
Mathematical Analysis of a Heat Exchange that can be Controlled by Computer (Analyse mathematique d'un echangeur de chaleur qui convient au controle par ordinateur),
W73-14470 2C

SNOWPACKS
Snow Amount in Relation to Streamflow and Herbage Production in Western Colorado,
W73-14479 3B

SOCIAL ASPECTS
Sociological Dimensions of Leisure Involvement in Water-Based Recreation,
W73-14211 6B

SOCIAL IMPACT
Water for the Future,
W73-14520 6B

SOCIAL PARTICIPATION
Sociological Dimensions of Leisure Involvement in Water-Based Recreation,
W73-14211 6B

SOCIAL VALUES
The Socio-Economic Dimension of Water Management,
W73-14506 6A

SOCIO-ECONOMIC IMPACT
The Socio-Economic Dimension of Water Management,
W73-14506 6A

SODIUM
The General Circulation of Water in Lake Chad,
W73-14279 2H

SODIUM CHLORIDE
Effect of Sodium Chloride Salinity on the Water Balance of Atriplex Halimus,
W73-14477 3C

SOIL AERATION
Soil Aeration and Sitka Spruce Seedling Growth in Peat,
W73-14744 2I

SOIL AGGREGATES
Characteristics of the Soil Matrix that Affect Water Storage and Movement,
W73-14467 2G

SOIL EROSION
Infiltration, Hydraulic Conductivity, and Resistance to Water-Drop Impact of Clod Beds as Affected by Chemical Treatment,
W73-14413 4D

Relative Detachability of Soil Particles by Simulated Rainfall,
W73-14414 2J

The Problem of Assessing the Erosive Power of Rainfall from Meteorological Observations,
W73-14415 2J

Soil Erosion--the Unmentioned Polluter,
W73-14720 2J

SOIL EROSION STANDARDS
Soil Erosion--the Unmentioned Polluter,
W73-14720 2J

SOIL FORMATION
Weathering of Biotite in Soils of a Humid Tropical Climate,
W73-14412 2G

SOIL MOISTURE
Systematic Treatment of Infiltration with Application,
W73-14205 2G

The NOAA/NESS Program of Remote Sensing of Soil Moisture,
W73-14330 7B

Characteristics of the Soil Matrix that Affect Water Storage and Movement,
W73-14467 2G

Study of Soil Platicity over A Wide Range of Moisture Contents (Issledovaniye plastichnosti pochv v shirokom intervale vlazhnosti),
W73-14604 2G

SOIL MOISTURE METERS
Coincidence and Interference Corrections for Dual-Energy Gamma Ray Measurements of Soil Density and Water Content,
W73-14424 2G

SOIL PHYSICAL PROPERTIES
A Comparison between Mercury Injection and Nitrogen Sorption as Methods of Determining Pore Size Distributions,
W73-14418 2G

SOIL PHYSICS
Study of Soil Platicity over A Wide Range of Moisture Contents (Issledovaniye plastichnosti pochv v shirokom intervale vlazhnosti),
W73-14604 2G

SOIL PROPERTIES
Effect of Waste Water from the Astrakhan' Cellulose and Pasteboard Combine on Soil Properties (Vliyaniye stochnykh vod Astrakhanskogo tsellyulozno-kartonnogo kombinata na svoystva pochv),
W73-14601 5D

SOIL SALINITY METERS
Response of Salinity Sensors to Rapidly Changing Salinity,
W73-14417 2G

SOIL STRUCTURE
The Relationship Between Soil Structure Factor and Both Soluble and Exchangeable Sodium and Calcium in the Nile Alluvium of Egypt,
W73-14474 2G

SOIL TEMPERATURE
Effects of Black Polyethylene Mulch on Soil Temperature, Soil Moisture, Weed Density and Yield of Mulberry Leaf Under Dry Farming Conditions in Mysore State,
W73-14748 3F

SOIL TREATMENT
Infiltration, Hydraulic Conductivity, and Resistance to Water-Drop Impact of Clod Beds as Affected by Chemical Treatment,
W73-14413 4D

SOIL WATER
Diernal Soil-Water Evaporation: Chloride Movement and Accumulation Near the Soil Surface,
W73-14422 2D

SOIL WATER MOVEMENT
Water Flow in Soil in Presence of Soybean Root Sinks,
W73-14367 2G

Prediction of Evaporation from Homogeneous Soil Based on the Flow Equation,
W73-14421 2D

Diurnal Soil-Water Evaporation: Time-Depth-Flux Patterns,
W73-14423 2D

A Mathematical Investigation of Steady Infiltration from Line Sources,
W73-14425 2G

Unsteady Two-Dimensional Flow of Water in Unsaturated Soils Above an Impervious Barrier,
W73-14426 2G

SOIL-WATER-PLANT RELATIONSHIPS
Some Factors Influencing Tolerance to Moisture Stress of three Range Grasses,
W73-14475 4A

OIL WATER SUCTION
Water Flow in Soil in Presence of Soybean Root Sinks,
W73-14367 2G

Characteristics of the Soil Matrix that Affect Water Storage and Movement,
W73-14467 2G

OILS
A Comparison between Mercury Injection and Nitrogen Sorption as Methods of Determining Pore Size Distributions,
W73-14418 2G

Description of Water-Salt Relations of Some Soils in Central Ciscaucasia From Lysimeter Experimental Data (Kharakteristika vodno-solevogo rezhima nekotorykh pochv Tsentral'-nogo Predkavkaz'ya po dannym lizimetricheskikh opytov),
W73-14605 2G

OLAR DISTILLATION
Humidification-Dehumidification Process (Solar Distillation),
W73-14388 3A

OLID WASTES
Metropolitan Comprehensive Water, Sewage, and Solid Waste Planning: Volume I--Background.
W73-14531 6A

Metropolitan Comprehensive Water, Sewage, and Solid Waste Planning Study: Volume II--Inventory Analysis and Plan.
W73-14532 6A

Metropolitan Comprehensive Water, Sewage, and Solid Waste Planning Study: Volume III--Short-range Development Program.
W73-14533 6A

A Systems Approach to Solid Waste Management in Asia: Bangkok, Thailand, As a Case Study,
W73-14674 5D

SOLITARY WAVES
Shallow-Water Waves,
W73-14644 2L

SOLVENT EXTRACTIONS
Separation of Molybdenum From Tungsten, Vanadium, Iron, Uranium and Several Other Interfering Elements by Extraction of Its Thiosulphato Complex,
W73-14246 5A

Role of Solvent Extraction Parameters in Governing the Potential Selectivity of Liquid Membrane Electrodes,
W73-14297 2K

SOLVENTS
1-Ephedrine in Chloroform as a Solvent for Silver Diethyldithiocarbamate in the Determination of Arsenic,
W73-14300 5A

SONAR
Sonar Mapping of the Underside of Pack Ice,
W73-14407 2C

SORGHUM
Efficiency of Water Use as Influenced by Micrometeorological and Physiological Processes,
W73-14206 2D

SOUNDS
The Circulation of Prince William Sound,
W73-14588 2L

Estuarine and Coastal Water Dynamics Controlling Sediment Movement and Plume Development in Long Island Sound,
W73-14590 2L

SOUTH CAROLINA
Private Sector Reaction to Normal Political Institutional Procedures and Outcomes when Water is an Issue,
W73-14210 6E

History of the South Carolina Oyster,
W73-14589 2L

SOUTH DAKOTA
Effect of Silt and Silt Removal In A Prairie Lake,
W73-14373 5C

SOVIET FAR EAST
Study of Glaciers in Siberia and Soviet Far East During Years of Soviet Rule (Izuchenive lednikov v Sibiri i na Dal'nem Vostoke za gody Sovetskoy vlasti),
W73-14428 2C

Oceanography (Okeanografiya).
W73-14597 2L

SOYBEANS
Water Flow in Soil in Presence of Soybean Root Sinks,
W73-14367 2G

SPAIN
The Natural Vegetation of the Southeast Spanish Dry Area,
W73-14677 4A

SPATIAL MODELS
A General Spatial Model: I. Application of Efficient Land Use,
W73-14257 4A

SPECIATION
Some Rotifers from Cambodia,
W73-14313 2I

SPECIFIC HEAT
Temperature Prospecting for Shallow Glacial and Alluvial Aquifers in Illinois,
W73-14714 4B

SPECTROPHOTOMETRY
Spectrophotometric Determination of Calcium,
W73-14251 2K

Correlation of Enhancement of Atomic Absorption Sensitivity for Selected Metal Ions with Physical Properties of Organic Solvents,
W73-14304 5A

Direct Vaporization and Quantification of Arsenic from Soils and Water,
W73-14416 5A

The Spectrophotometric Determination of Palladium with 4- ((5-Chloro-2-Pyridyl)AZO)-1,3-Diaminobenzene,
W73-14440 5A

Atomic Absorption and Fluorescence Spectrometry with a Carbon Filament Atom Reservoir. Part XIII. The Determination of Chromium with a Fully Enclosed Atom Reservoir,
W73-14441 5A

Determination of Aluminium by Atomic Absorption Spectrophotometry after Chelation with Oxine and Extraction with Methyl Isobutyl Ketone,
W73-14454 5A

SPECTROSCOPY
The Analysis of Tritium Oxide from Selected Areas of the Connecticut River,
W73-14362 5A

SPORT FISHING
The Grand Traverse Bay Sport Fishery: Angler Activity, Revenue, and Economic Impact,
W73-14409 6B

SPRAY IRRIGATION
Report on Makeup Water for the Upper Canyon Lakes, Lubbock, Texas.
W73-14236 5G

Spray Irrigation of Sewage Effluent and Sludge,
W73-14612 5D

SPRINGFIELD (MASS)
Riverfront Development Plan, Connecticut River, Springfield, Massachusetts.
W73-14676 3D

SPRINGS
Mineral and Thermal Waters of Canada,
W73-14607 2F

SPRUCE
Effect of Clearcutting a Black Spruce Bog on Net Radiation,
W73-14736 2D

Soil Aeration and Sitka Spruce Seedling Growth in Peat,
W73-14744 2I

SPRUCE BEETLES
Comparative Evaluation of Thermal Profile Data of Healthy and Infested Englemann Spruce,
W73-14337 7B

SPYRIDIA FILAMENTOSA
Examination of Ultrastructure and Growth of the Cell Wall of Spyridia Filamentosa (Wulf.) Harv., Untersuchungen Uber Bau und Wachstum Der Zellwande Von Spyridia Filamentosa (Wulf.) Harv.),
W73-14439 5C

ST LAWRENCE ESTUARY
Monroes: A Type of So-Called Mud Volcanoes in Tidal Flats,
W73-14580 2L

ST. LAWRENCE SEAWAY
Extending the St. Lawrence Seaway Navigation Season: The Cost-Benefit Approach,
W73-14508 6B

ST. LOUIS (MISSOURI)
Study of Urban Effects on Precipitation at St. Louis,
W73-14539 2B

STANDARD ADDITION TECHNIQUE
Estimating Precision for the Method of Standard Additions,
W73-14305 2K

STATE GOVERNMENTS
Private Sector Reaction to Normal Political Institutional Procedures and Outcomes when Water is an Issue,
W73-14210 6E

STATE GOVERNMENTS

Environmental Impact Requirements in the States,
W73-14749 5G

STATISTICAL METHODS

A Computer Program for Generating Scattergrams on the Calcomp Plotter,
W73-14340 7C

An Appraisal of the Significance of Sieve Intervals in Grain Size Analysis for Environmental Interpretation,
W73-14576 2J

STATISTICAL MODELS

W73-14665 2L

TEMPERATURE CONTROL
Mathematical Analysis of a Heat Exchange that can be Controlled by Computer (Analyse mathematique d'un echangeur de chaleur qui convient au controle par ordinateur),
W73-14470 2C

TENNESSEE
Flood Plain Information, Clarksville, Tennessee.
W73-14238 4A

Strip-mined Watershed Hydrologic Data Acquisition Study,
W73-14368 7B

Obion and Forked Deer Rivers and Tributaries, Tennessee and Kentucky, Interim Report: Harris Fork Creek.
W73-14502 4A

Water and Wastewater Plan for Anderson, Blount, and Knox Counties, Tennessee - Volume I, Water Supply and Distribution.
W73-14682 5G

Water and Wastewater Plan for Anderson, Blount, and Knox Counties, Tennessee - Volume II, Wastewater Collection and Treatment.
W73-14683 5G

TENNESSEE RIVER
Cluster Analysis and Water Project Evaluation,
W73-14510 6B

TENSILE STRENGTH
Burst Resistance of Pipe Cemented into the Earth,
W73-14715 8F

Physical and Thermal Properties of Frozen Soil and Ice,
W73-14717 8D

TERRACING
Runoff, Erosion, and Tillage Efficiency on Graded-Furrow and Terraced Watersheds,
W73-14410 4D

Water Yield and Erosion Response to Land Management,
W73-14411 4D

TERRAIN ANALYSIS
Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands.
W73-14326 7B

Vegetation-Terrain Feature Relationships in Southeast Arizona,
W73-14336 7B

Progress on Geologic-Terrain Mapping for Land-Use Planning in the Tucson Area,
W73-14348 7C

TERTIARY TREATMENT
Study of Upflow Filter for Tertiary Treatment,
W73-14217 5D

Mathematical Simulation of Ammonia Stripping Towers for Wastewater Treatment,
W73-14229 5D

A Pilot Plant Investigation of the Pulsed Adsorption Bed Process,
W73-14389 5D

Artificial Aeration as a Substitute for Wastewater Treatment,
W73-14464 5G

TESTACEA
The Testacea in the Area of Buschelbach Station (Bieber/Spessart, Germany), (Die Testaceen in der Umgebung der Station Buschelbach (Spessart/Brd)),
W73-14314 2I

TEXAS
Report on Makeup Water for the Upper Canyon Lakes, Lubbock, Texas.
W73-14236 5G

Amarillo, Texas: Report on Water Distribution System, 1967.
W73-14243 6D

Nitrogen and Phosphorus in a Stretch of the Guadalupe River, Texas, with Five Main-Stream Impoundments,
W73-14249 5B

Dynamics of Playa Lakes in the Texas High Plains,
W73-14356 7B

Mathematical Management Model of Parts of The Ogallala Aquifer, Texas,
W73-14359 4B

Chemical Composition of Six Southern Great Plains Grasses as Related to Season and Precipitation,
W73-14482 4A

Amarillo, Texas: Report on Sanitary Sewerage and Sewage Treatment, 1967.
W73-14501 5D

Effect of Fish Removal on the Growth and Condition of White Shrimp, Penaeus Setiferous (Linnaeus), in Brackish Ponds,
W73-14587 2L

A Review of the Characteristics, Behavior and Design Requirements of Texas Gulf Coast Tidal Inlets,
W73-14618 2L

THAILAND
A Systems Approach to Assessment of Rural Water Supply Program Effectiveness,
W73-14669 6B

THAILAND (BANGKOK)
A Systems Approach to Solid Waste Management in Asia: Bangkok, Thailand, As a Case Study,
W73-14674 5D

THALLIUM
Isotachophoresis on Paper Part II The Separation of Ag (I), Tl (I), Hg2 (2 plus) and Pb (II),
W73-14449 5A

THEMATIC MAPS
Production of Thematic Maps by Optical Analog Processing of Color Transparencies,
W73-14339 7B

THEORETICAL ANALYSIS
Externalities, Factor Proportions and the Level of Exploitation of Free Access Resources,
W73-14507 6C

Pollution in a Neo-Classical World.--The Classics Rehabilitated,
W73-14513 5G

THERMAL CONDUCTIVITY
The Effects of Porous and Solid Fillers on the Permeability of Cellulose Acetate Membranes,
W73-14378 3A

THERMAL INFRARED IMAGERY
Thermal Remote Sensing on the Mississippi River in Iowa,
W73-14286 5A

THERMAL MAPPING
Thermal Remote Sensing on the Mississippi River in Iowa,
W73-14286 5A

THERMAL POLLUTION
A Selected Annotated Bibliography on Water Resources of the State of Washington.
W73-14201 2E

A Selected Annotated Bibliography on Columbia and Snake Rivers.
W73-14202 2E

Round Horizontal Thermal-Buoyant Jet in a Cross Flow,
W73-14212 5B

Thermal Effects,
W73-14268 5C

Thermal Remote Sensing on the Mississippi River in Iowa,
W73-14286 5A

Feasibility Study of a Nuclear Power-Sewage Treatment System for the Conservation and Reclamation of Water Resources,
W73-14360 5D

Chlorine and Temperature Stress on Estuarine Invertebrates,
W73-14447 5C

Student Projects on Coastal Zone and Offshore Resources Management,
W73-14615 2L

THERMAL SPRINGS
Mineral and Thermal Waters of Canada,
W73-14607 2F

THERMAL STRESS
Cadmium Uptake by Fiddler Crabs Exposed to Temperature and Salinity Stress,
W73-14307 5C

Chlorine and Temperature Stress on Estuarine Invertebrates,
W73-14447 5C

THERMOCLINE
Periodic Motions of the Seasonal Thermocline Along the Southern California Coast,
W73-14646 2E

THERMODYNAMICS
An Approach to Coupling the Dynamics and Thermodynamics of Arctic Sea Ice,
W73-14402 2C

On the Thickness Distribution of Sea Ice,
W73-14403 2C

THREE-SPINED STICKLEBACK
Toxicity Assessment of Treated Municipal Wastewaters,
W73-14258 5C

THUNDERSTORMS
New Method of Forecasting Mudflows from Thunderstorms (Novyy metod prognozirovaniya selevykh potokov po grozam),
W73-14599 2J

TIDAL EFFECTS
Coastal Processes and Beach Erosion,
W73-14633 2J

Beach Changes at Virginia Beach, Virginia,
W73-14652 2J

Beach Cycles Related to Tide and Local Wind Wave Regime,
W73-14653 2J

TIDAL ESTUARIES
Lateral Diffusion in a Tidal Estuary,
W73-14647 2L

TIDAL FALLS
Oceanographic Surveys of Traitors Cove Revillagigedo Island, Alaska,
W73-14657 2L

TIDAL FLUSHING
Salinity Variations in the Connecticut River,
W73-14659 2L

TIDAL INLETS
A Review of the Characteristics, Behavior and Design Requirements of Texas Gulf Coast Tidal Inlets,
W73-14618 2L

TIDES
Salt-Water Intrusion in Prince Edward Island,
W73-14645 2L

Periodic Motions of the Seasonal Thermocline Along the Southern California Coast,
W73-14646 2E

Salinity Variations in the Connecticut River,
W73-14659 2L

TIME-LAPSE PHOTOGRAPHY
Multispectral Remote Sensed Image Analysis by a Special Electronic System,
W73-14338 7B

TIME SERIES ANALYSIS
A Simulation Technique of Monthly Runoff by Use of Precipitation Time Series at Multistations,
W73-14562 2A

Evaluation of Multiannual Firm Hydroelectric Power--A New Method,
W73-14566 2A

TITANIUM
Reactions and Transport Phenomena At Surfaces,
W73-14381 3A

TOPOGRAPHIC MAPPING
Basic Considerations of High Resolution Side-Looking Radar Imagery,
W73-14332 7B

TOPOGRAPHY
Arctic Sea Ice Ridge Frequency Distributions Derived from Laser Profiles,
W73-14408 2C

Basic Patterns in the Geologic Activity of Streams in Mountainous Areas (Osnovnyee zakonomernosti geologicheskoy deyatel'nosti rek gornykh stran),
W73-14603 2J

TORQUE
Failures in the Bottom Joints of Surface and Intermediate Casing Strings,
W73-14712 8G

TOTAL ORGANIC CARBON
A Pilot Plant Investigation of the Pulsed Adsorption Bed Process,
W73-14389 5D

TOXICITY
The Environmental Toxicity of Crassin Acetate Using Tetrahymena pyriformis as a Model,
W73-14255 5C

Toxicity Assessment of Treated Municipal Wastewaters,
W73-14258 5C

Heavy Metals: A Review of Lead,
W73-14267 5B

Biological Effects of Fenitrothion in the Diet of Brook Trout,
W73-14398 5C

Plant Phenols and Related Organic Compounds in Public Water Sources, Their Relationship to Chlorination,
W73-14468 5B

Experimental Data for Substantiating the Residual Concentrations of Chlorine Dioxide in Drinking Water, (In Russian),
W73-14707 5C

TRACERS
The Use of Tracer Data in Increasing the Information on Hydrologic Systems,
W73-14558 2A

Fluorescent Tracer Particle Determination of the Size-Velocity Relation for Foreshore Sediment Transport, Sandy Hook, New Jersey,
W73-14640 2J

Experimental Study of Waterflood tracers,
W73-14727 2E

TRAINING
Nebraska Water Resources Research Institute - Past, Present and Future.
W73-14209 9A

Water Supply Projects in Developing Countries,
W73-14716 4A

TRANSMUTATION
Ultimate Management of Radioactive Liquid Wastes,
W73-14390 5G

TRANSPARENCY
Turbidity, Transparency and Color of Water in the Estuary Area (Mutnost', Prozrachnost' I Tsvet Vod Vzmor'ya),
W73-14637 2L

TRANSPIRATION
Ecological Response of the Australian Native Species Acacia Harpophylla and a Triplex Nummularia to Soil Salinity: Effects on Water Content, Leaf Area, and Transpiration Rate,
W73-14472 3C

TRANSPIRATION CONTROL
Antitranspirants: A Possible Alternative to the Eradication of Saltcedar Thickets,
W73-14226 3B

TREATMENT
Depuration of Biloxi Bay Oysters by Relaying,
W73-14593 5C

TREATMENT FACILITIES
Guide to the Preparation of Operational Plans for Sewage Treatment Facilities,
W73-14214 5D

Wastewater Conveyance Models,
W73-14465 5G

Des Moines Metropolitan Sanitary Sewerage System Study: Part B--Main Sewage Treatment Plant.
W73-14529 6A

Report on Regional Wastewater Treatment Facilities for the Frederick Metropolitan Area, Frederick County, Maryland.
W73-14541 6A

TREE STEMS
Seasonal Water Movement in Tree Stems,
W73-14739 2I

TRITIUM OXIDE
The Analysis of Tritium Oxide from Selected Areas of the Connecticut River,
W73-14362 5A

TROPICAL REGIONS
Weathering of Biotite in Soils of a Humid Tropical Climate,
W73-14412 2G

TROUT
Parametric Determination of Minimum Stream Flow for Trout,
W73-14213 8I

Effects of Controlled Flow Reduction on a Trout Stream,
W73-14745 8I

TSUNAMIS
Refraction of Dispersive Waves on a Beach,
W73-14628 8B

Tsunamis As Geological Agents,
W73-14648 2E

TUBIFICIDS
Selected Metals in Sediments, Water, and Biota in the Illinois River,
W73-14308 5B

TUCSON (ARIZ)
Progress on Geologic-Terrain Mapping for Land-Use Planning in the Tucson Area,
W73-14348 7C

TULARE COUNTY (CALIF)
Water and Liquid Waste Management: Policies, Systems Plans, Program.
W73-14497 5G

Water and Liquid Waste Management: Policies, Systems Plans, Program-Part II.
W73-14498 5G

TURBIDITY
Dynamics of Suspended Sediment Plumes in Lake Ontario,
W73-14354 7B

Inexpensive Dual Beam Turbidimeter,
W73-14575 2J

Turbidity, Transparency and Color of Water in the Estuary Area (Mutnost', Prozrachnost' I Tsvet Vod Vzmor'ya),
W73-14637 2L

TURBULENCE
Oceanographic Surveys of Traitors Cove Revillagigedo Island, Alaska,
W73-14657 2L

TURBULENT FLOW
Rheological Design of Cementing Operations,
W73-14705 8F

TURKMEN SSR
New Method of Forecasting Mudflows from Thunderstorms (Novyy metod prognozirovaniya selevykh potokov po grozam),
W73-14599 2J

TWO-PHASE FLOW
Systematic Treatment of Infiltration with Application,
W73-14205 2G

U.S. GEOLOGICAL SURVEY
Geographic Investigations Associated with the Eros Program of the Department of the Interior,
W73-14346 7B

ULTRAPURE WATER
Ultrapurification of Water for Electrochemical and Surface Chemical Work by Catalytic Pyrodistillation,
W73-14302 5A

ULTRASTRUCTURE
Examination of Ultrastructure and Growth of the Cell Wall of Spyridia Filamentosa (Wulf.) Harv., Untersuchungen Uber Bau und Wachstum Der Zellwande Von Spyridia Filamentosa (Wulf.) Harv.),
W73-14439 5C

ULTRATHIN MEMBRANES
Research on Improved Reverse Osmosis Membranes,
W73-14386 3A

UNITED ARAB REPUBLIC
The Effect of Gradual Leaching on the Growth and Yield of Sugar Cane in Saline Soils,
W73-14473 3C

UNITED STATES
Water Use, Consumption, and Outlook in the U.S. in 1970,
W73-14355 6D

A Comparison of Urban Water Use in Australia and the U.S.,
W73-14483 6D

UNIVERSITIES
Inventory of Water Resources Conducted In Minnesota 1963 through 1972,
W73-14366 9D

UNSATURATED FLOW
Systematic Treatment of Infiltration with Application,
W73-14205 2G

Unsteady Two-Dimensional Flow of Water in Unsaturated Soils Above an Impervious Barrier,
W73-14426 2G

UPFLOW FILTER
Study of Upflow Filter for Tertiary Treatment,
W73-14217 5D

UPPER SALT RIVER (KY)
An Annotated List of Fishes From the Upper Salt River, Kentucky,
W73-14544 2I

UPWELLING
Copepod Indicators of Surface Water Movements off the Oregon Coast,
W73-14620 2L

URBAN DRAINAGE
Flood Control Report, Casa Grande, Arizona, 1973.
W73-14476 4A

URBAN GROWTH POLICIES
Water and Liquid Waste Management: Policies, Systems Plans, Program.
W73-14497 5G

Water and Liquid Waste Management: Policies, Systems Plans, Program-Part II.
W73-14498 5G

URBAN LAND USE
Water, Sewer, and Storm Drain Study, Utah County, Utah, Volume I: Background and Inventory.
W73-14492 5D

URBANIZATION
Study of Urban Effects on Precipitation at St. Louis,
W73-14539 2B

USE RATES
Pricetag to Industry,
W73-14518 5D

USSR
Problems of Water Resources Use and Conservation (Problemy vodnykh resursov, ikh ispol'zovaniya i okhrany),
W73-14427 6B

Is There Ample Freshwater on Earth, (Mnogo li presnoy vody na Zemle),
W73-14602 2A

USSR (VORSKLA RIVER)
Information on the Study of Phytoplankton of the Higher Part of the Vorskla River, (In Russian),
W73-14626 5C

UTAH COUNTY (UTAH)
Water, Sewer, and Storm Drain Study, Utah County, Utah, Volume I: Background and Inventory.
W73-14492 5D

Water, Sewer and Storm Drain Study, Utah County, Utah Volume II, Plan Report
W73-14493 5D

UTILITIES EXTENSION
Water Distribution and Wastewater Collection Systems in Forsyth County, North Carolina with Urban Development Forecasts: 1968-1978-2010.
W73-14233 5D

UTILITY EXTENSION
Water, Sewer, and Storm Drain Study, Utah County, Utah, Volume I: Background and Inventory.
W73-14492 5D

Water and Wastewater Plan for Anderson, Blount, and Knox Counties, Tennessee - Volume I, Water Supply and Distribution.
W73-14682 5G

UTILITY EXTENSION POLICIES
Water and Liquid Waste Management: Policies, Systems Plans, Program.
W73-14497 5G

Water and Liquid Waste Management: Policies, Systems Plans, Program-Part II.
W73-14498 5G

Water and Wastewater Plan for Anderson, Blount, and Knox Counties, Tennessee - Volume I, Water Supply and Distribution.
W73-14682 5G

VALUE
Economic Evaluation of Sport Fisheries--What Do They Mean,
W73-14514 6B

VARIABILITY
Investigation of the Nature of Variations in Annual Runoff Coefficients in West Siberia (Issledovaniye prirody kolebaniy koeffitsiyentov godovogo stoka Zapadnoy Sibiri),
W73-14429 2E

The Hydrological Feasibility of Variable Water Supply Policies,
W73-14570 2A

VARVES
A Special Mechanism for Varve Formation In a Glacial Lake,
W73-14581 2J

VEGETATION
Vegetation-Terrain Feature Relationships in Southeast Arizona,
W73-14336 7B

Origins and Ecology of the Sierran Alpine Flora and Vegetation,
W73-14545 4A

The Biomass, Productivity, and Phytogeochemistry of the Vegetation of the Banks of a Stream in Ardenne (The Gembes Stream at Daverdisse, Luxembourgian Part of the Ardenne Region): II. Phytogeochemical Survey, (In French),
W73-14596 2I

The Natural Vegetation of the Southeast Spanish Dry Area,
W73-14677 4A

VEGETATION EFFECTS
Snow Amount in Relation to Streamflow and Herbage Production in Western Colorado,
W73-14479 3B

VIRGINIA
Sediments of the James River Estuary, Virginia,
W73-14656 2L

VIRGINIA BEACH
Beach Changes at Virginia Beach, Virginia,
W73-14652 2J

VIRUSES
Microbiology-Detection and Occurrence of Viruses,
W73-14264 5A

Kinetics of Viral Inactivation by Bromine,
W73-14395 5F

VISCOSITY
Rheological Design of Cementing Operations,
W73-14705 8F

VITAMINS
Calculation of Turbidimetric Microbiological Vitamin Assay Results, Using an APL/360 Computer program,
W73-14448 5A

VOLATILIZATION
Environmental Analysis Problems Created by Unexpected Volatile Beryllium Compounds in Various Samples,
W73-14299 2K

VOLGA REGION
Simplest Organic Acids in Groundwater of the Lower Volga Region (Genesis and Possible use in Prospecting for Oil) (Nizshiye organicheskiye kisloty v podzemnykh vodakh Nizhnego Povolzh'ya (genesis i vozmozhnost' ispol'zovaniya v neftepoiskovykh tselyakh),
W73-14434 2K

VOLUMETRIC LIQUID PHASE
New Method for Evaluation of Dissolved Oxygen Probe Response for K sub L a Determination,
W73-14452 5A

VORTICES
Laser Doppler Velocity Measurements of Swirling Flows with Upstream Influence,
W73-14571 8B

WAGES
A New Concept for Operator Wages,
W73-14511 5D

WASHINGTON
A Selected Annotated Bibliography on Water Resources of the State of Washington.
W73-14201 2E

Puyallup Hatchery Pond and Pumping Plant Construction,
W73-14357 8I

Design for Future Program Construction,
W73-14522 8I

Distribution and Composition of Suspended Sediment in the Bottom Waters of the Washington Continental Shelf and Slope,
W73-14583 2J

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.
- Water treatment plant waste pollution control at American Water Works Association.
- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 6, NUMBER 24
DECEMBER 15, 1973

W73-14751 -- W73-15300

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1B. Aqueous Solutions and Suspensions

RAMAN SPECTRA AND STRUCTURE OF WATER IN DIMETHYL SULFOXIDE,
Western Regional Research Lab., Berkeley, Calif.
J. R. Scherer, M. K. Go, and S. Kint.
Journal of Physical Chemistry, Vol 77, No 17, p 2108-2117, Aug 16, 1973. 15 fig, 2 tab, 46 ref.

Descriptors: *Spectroscopy, *Sulfur compounds, *Water structure, *Molecular structure, Water properties, Water, Hydrogen bonding, Structural models, Resonance, Heavy water, Water types, Temperature.
Identifiers: *Raman spectra, Dimethyl sulfoxide, Symmetry, Mixtures, Hydroxyl groups.

A simple model is proposed for the structure of liquid water that explains the concentration and temperature dependence of the Ramam spectra of water in mixtures with dimethyl sulfoxide. The model proposes two states for a hydrogen-bonded water molecule. One state involves a symmetrically, the other state an asymmetrically H-bonded species. The symmetric molecule exhibits a symmetric OH stretching vibration that is infrared and Raman-active plus an antisymmetric OH stretching vibration that is active in the IR and anisotropic Raman spectra but forbidden in the isotropic Raman spectrum. The asymmetric molecule has two OH stretching vibrations of which one involves the H-bonded OH, and the other the weakly H-bonded OH. Fermi resonance with the overtone of the bending vibration is shown to affect the spectra of both the symmetric and the antisymmetric OH stretching vibrations. The resonance constants for liquid water and heavy water (deuterium oxide) agree with vapor-phase results. A questionable third state involving two weak H bonds is proposed to account for weak scattering in the high-frequency region that is not explicable by the two-state model. The change in depolarization ratio across the OH stretching region is readily understood in terms of this model and agrees well with corresponding data for HOD. (Brown-IPC)

2A. General

ANALYSIS OF MULTIPLE-INPUT STOCHASTIC HYDROLOGIC SYSTEMS,
Illinois Univ., Urbana. Dept. of Civil Engineering.
V. T. Chow.
Available from the National Technical Information Service as PB-223 870, $3.75 in paper copy, $1.45 in microfiche. Illinois University Water Resources Center Research Report No 67, July 1973. 66 p, 18 fig, 3 tab, 10 ref, appendix. OWRR B-038-ILL (10).

Descriptors: *Hydrology, *Watersheds (Basins), *Systems analysis, *Hydrologic systems, Model studies, Stochastic processes, Synthetic hydrology, Watershed management, Streamflow forecasting, *Illinois.
Identifiers: *Sangamon River basin (Ill).

The development of a multiple-input stochastic hydrologic system model is described for the analysis of hydrologic behavior of watersheds. Various components of the hydrologic system are expressed by time series, each containing a trend component, a periodic component and a stochastic residual component. For modeling the multiple-input system, a Markov-type mathematical formulation is proposed. For illustrative purposes, the model is applied to the analysis of monthly precipitations and streamflows of the upper Sangamon River basin in Illinois. The results indicate that the proposed model is feasible for the basin and thus can be used for filling missing streamflow data or generating stochastic streamflow sequences. (Woodard-USGS)
W73-14753

SIMULATION OF THE QUANTITY AND QUALITY OF FLOW IN A RIVER BASIN,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
C. C. S. Song, A. F. Pabst, and C. E. Bowers.
Available from the National Technical Information Service as PB-223 964, $3.75 in paper copy, $1.45 in microfiche. Project Report No. 145, June 1973. 34 p, 25 fig, 3 tab, 19 ref. OWRR A-024-MINN (1).

Descriptors: *Mathematical models, *Systems analysis, Water quality, *River basins, *Minnesota, *Simulation analysis, Model studies, River flow, Synthetic hydrology.
Identifiers: Water quantity.

The objective was the simulation of the quantity and quality of flow in a fairly large basin on a continuous synthesis basis. An existing mathematical model was modified slightly and fitted to the 16,200 square mile Minnesota River Basin. The model used was the SSARR (Streamflow Synthesis and Reservoir Regulation) model developed by the Corps of Engineers and the National Weather Service for the Columbia Basin. A stochastic water quality model was developed and fitted to portions of the Minnesota Basin for use with the quantity model. A deterministic water quality model was written for the main stem of the Minnesota River. Preliminary results using water temperature data show good agreement with measured data. (Walton-Minnesota)

QUANTITATIVE HYDROLOGIC STUDY OF A CLOSED BASIN WITH A PLAYA (ESTANCIA VALLEY, NEW MEXICO),
New Mexico Inst. of Mining and Technology, Socorro. Dept. of Geoscience.
B. E. DeBrine.
Available from the National Technical Information Service as PB-223 928, $11.00 in paper copy, $1.45 in microfiche. PhD Desertation May 1971, 165 p, 12 tab, 26 fig, 4 plates, 1 append, 42 ref. OWRR B-005-NMEX (2).

Descriptors: *New Mexico, *Playas, *Water budget, Hydrology, *Groundwater flow, Darcy's Law, Pumping, Evaporation, Aquifers, Hydrogeology, Aquifer testing, Precipitation (Atmospheric), Water level fluctuations, Drawdown, Evaporation pans, Climatic data, Inflow, *River basins, Computer programs.
Identifiers: *Estancia Valley (N Mex), Potential evaporation.

Few quantitative hydrologic studies of closed basins discharging ground water through playa systems have been made. A water budget was determined for a small test area of the Estancia Valley in central New Mexico which offers a unique, highly saline, perennially moist, environment in its playa discharge region. Ground water inflow was determined by Darcy's Law in the form: Q = TIL, using the results of several aquifer tests and water level data from a well monitoring program. Evaporative discharge was determined from climatic data, collected at a weather station located on a playa near the test area, utilizing several existing techniques. These techniques were modified and adapted to fit the unique conditions of the Estancia playas. Computer programs were developed to process the climatic data. The results show that between 340 and 455 acre-feet of ground water is discharged by evaporation in the test area each year. Extending these results to the entire Estancia system shows that between 27,000 and 36,000 acre-feet of ground water is discharged annually by the playas. (Creel-New Mexico)

HYDROLOGY OF SEASONALLY INUNDATED AFRICAN HEADWATER SWAMPS,
National Council for Scientific Research, Lusaka (Zambia). Water Resources Unit.
J. Balek, and J. E. Perry.
Journal of Hydrology, Vol 19, No 3, p 227-249, July 1973. 10 fig, 8 tab, 11 ref.

Descriptors: *Water balance, *Swamps, *Rainfall-runoff relationships, Water storage, Water yield, Runoff, Streamflow, Wetlands, *Africa, Seepage, Surface-groundwater relationships, Base flow.
Identifiers: *Dambos.

African seasonally inundated headwater swamps (dambos) play a very important role in the African natural resources economy because they act as storage reservoirs absorbing water during the rainy season and giving it up slowly during the dry season. The hydrological response of the catchment to the precipitation depends on the size of the dambo area within a catchment; from a higher percentage of dambo area, a higher surface runoff volume occurs. Surface runoff forms the largest part of the total runoff in all the catchments containing a dambo. The duration of the surface runoff as compared with a nonswampy area of similar shape and size is delayed by the resistance of dambo grasses to the flow. The dambos are recharged shortly after the rainly season starts and release the water within a constant time interval after the last heavy storm. The length of the interval depends on the soil type forming the dambo and on the slope. Groundwater storage in the catchments is depleted more by evapotranspiration than by the base flow. The evapotranspiration by the woodland is approximately three times higher than the evapotransporation by the dambo grasses. Only a part of the woodland area contributes toward the formation, of the hydrograph during a period, the length of which depends upon the mean groundwater level at the end of the rainy season. (Knapp-USGS)

LOG-NORMAL STREAMFLOW GENERATION MODELS REEXAMINED,
Monash Univ., Clayton (Australia). Dept. of Civil Engineering.
G. P. Codner, and T. A. McMahon.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY9, Paper 10002, p 1421-1431, September 1973. 5 tab, 15 ref, append.

Descriptors: *Synthetic hydrology, *Simulation analysis, *Streamflow forecasting, Statistical methods, Markov processes, Stochastic processes, Mathematical models, *Water storage, Water yield, *Australia, Model studies.

Data from several Australian rivers were used to examine three monthly log-normal streamflow generation models. The first model is based on Fiering's skewed transformation equations which are applied to logs of monthly flows. The other two models are based on two- and three-parameter log-normal distributions using moment transformation equations. Some deficiencies were noted in three procedures for computing storage size--the behavior approach, the sequent peak method and Gould's storage analysis. Length and number of traces were also studied. Large implied skew in the two-parameter model results in lower storage estimates than those found from the three-parameter model. Errors in the historical mean are more significant in relation to storage estimates than errors in serial correlation. The number of traces generated need only be sufficient to define storage mean and to indicate variability. (Knapp-USGS)

CONFERENCE ON THE HYDROLOGIC CYCLE IN NATURE AND ITS ROLE IN FORMATION OF FRESHWATER RESOURCES (SOVESHCHANIYE PO PROBLEME 'VLAGOOBOROT V PRIRODE I YEGO ROL' V FORMIROVANII RESURSOV PRESNYKH VOD'),
L. P. Kuznetsova, and Yu. V. Kurilova.
Vodnyye Resursy, No 2, p 197-199, 1972.

Descriptors: *Conferences, *Hydrologic cycle, *Water resources, *Freshwater, Surface waters, Hydrology, Meteorology, Satellites (Artificial), Isotope studies.
Identifiers: *USSR, Water exchange.

An All-Union conference devoted to the hydrologic cycle and its role in formation of freshwater resources and organized by the USSR Academy of Science's Institute of Water Problems was held in Moscow January 10-13, 1972. Participants in the conference included 170 specialists from 40 Soviety scientific research institutes and universities as well as scientists from socialist countries. Of the 24 papers presented, 13 were from institutes of water problems, atmospheric physics, and geography of the USSR Academy of Sciences and 11 from institutes of the Hydrometeorological Service and Leningrad State University. Major topics examined were problems of the hydrologic cycle and surface waters. Of particular interest were papers devoted to methods of investigation of certain hydrological and meteorological phenomena by artificial earth satellites and natural isotopes. Main trends in investigations of problems on water exchange in nature were outlined. (Josefson-USGS)

Descriptors: *Organizations, *Hydraulics, *Hydraulic structures, Conferences.
Identifiers: *USSR.

The International Association for Hydraulic Research (IAHR) was founded to stimulate and develop theoretical, experimental, and applied hydraulic research through publication and organization of international congresses, symposia, seminars, and regional meetings devoted to current problems in modern hydraulics. In the Soviet Union all activities associated with IAHR are carried out through the Soviet National Committee (SNC) of the Assoication. The Committee is governed by a presidium consisting of a chairman, 3 deputy chairmen, and a secretary and includes 41 specialists from 29 Soviet organizations engaged in hydraulic research. Eight technical committees have been organized by SNC to study theoretical principles of hydraulics; conveyance structures; hydraulic machinery, equipment, and cavitation; ice problems; river hydraulics; polyphase fluids; marine and coastal hydraulics; and infiltration. A ninth technical committee on water-management systems is planned. (Josefson-USGS)
W73-15014

FOURTH ALL-UNION HYDROLOGY CONGRESS (IV VSESOYUZNYY GIDROLOGICHESKIY S'YEZD),
V. Zakharov.
Vodnyye Resursy, No 2, p 201-202, 1972.

Descriptors: *Conferences, *Hydrology, Water balance, Runoff, Forecasting, Surface-groundwater relationships.
Identifiers: *USSR.

On the suggestion of the Main Administration of the Hydrometeorological Service, a Fourth All-Union Hydrology Congress will be held in Leningrad in October 1973 to assess the status of hydrologic studies in the USSR and to discuss major problems in the development of hydrology. Nine panels will be set up to discuss water balance and runoff computations; hydrologic problems of water management; hydrologic forecasts; surface-groundwater relationships; hydrology of lakes, reservoirs, and estuaries; water quality and scientific principles of water conservation; channel processes; hydrometry and water control; and hydrophysics. Approximately 20 papers will be discussed by each panel. (Josefson-USGS)
W73-15015

TWENTY-FIFTH HYDROCHEMISTRY CONFERENCE (XXV GIDROKHIMICHESKOYE SOVESHCHANIYE),
V I Popov
Vodnyye Resursy, No 2, p 203, 1972.

Descriptors: *Conferences, *Water chemistry, *Water quality, *Water pollution, *Self-purification, Surface waters, Water analysis
Identifiers: *USSR

The Twenty-Fifth Hydrochemistry Conference, organized by the Hydrochemical Institute of the Main Administration of the Hydrometeorological Service and devoted to the problem 'Status and Prospects of Development of Studies on Pollution and Self-Purification of Surface Waters of Land Areas,' was held in Novocherkassk, May 16-19, 1972. Conference participants included scientific workers and specialists from institutes in Novocherkassk, Moscow, Leningrad, Kiev, Tallin, Petrozavodsk, Perm', Tartu, Alma-Ata, Sochi, and other cities. The 32 papers of the conference dealt with problems of pollution and self-purification of water bodies; forecasts of water quality of rivers and reservoirs; methods of water-quality evaluation; and automation in monitoring chemical composition of surface waters. Following the conference, a symposium was held at which 12 papers on techniques of water chemical analysis were presented. (Josefson-USGS)
W73-15016

RELATIONSHIP OF OBSERVED RAINFALL AND RUNOFF RECURRENCE INTERVALS,
Minnesota Univ., St. Paul. Dept. of Agricultural Engineering.
C. L. Larson, and B. M. Reich.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 34-43, 1973. 3 fig, 2 tab, 8 ref.

Descriptors: *Rainfall-runoff relationships, *Design flow, *Design storm, Frequency analysis, Flood recurrence interval, Statistics, Statistical methods.

For most small watersheds, design runoff must be predicted by parametric methods which utilize generalized rainfall data and the physical characteristics of the watersheds. Implicit in these methods is the assumption that the recurrence interval of runoff is equal to that of the rainfall. Peak flows from 20 small watersheds in Pennsylvania for periods of 11 to 30 years were analyzed along with maximum storm rainfall amounts. For individual years, the runoff and rainfall ranks were seldom equal. However, the runoff rank exceeds the rainfall rank with about the same frequency that the rainfall rank exceeds the runoff rank. Despite high variability for individual years, storm rainfall and runoff rank and recurrence interval have a distinct central tendency toward being equal. Thus, for design purposes, the assumption of equality is justified and appropriate. (Knapp-USGS)
W73-15032

THE ROLE OF LAG IN A QUASI-LINEAR ANALYSIS OF THE SURFACE RUNOFF SYSTEM,
Technion - Israel Inst. of Tech., Haifa.
M. H. Diskin.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 133-144, 1973. 4 fig, 10 ref.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, *Time lag, Systems analy-

sis, Variability, Unit hydrographs, Input-output analysis.

The surface runoff system, defined in terms of rainfall excess as its input and direct surface runoff as its output, is considered to be nonlinear. Its departure from linearity is however not large as is evident from the fairly successful results by the use of linear models. This fact leads to the idea of developing a quasi-linear approach in modeling. The linear convolution integral is assumed to represent the rainfall-runoff relationship during any one storm, but the kernel function (or IUH) is taken to be different for various storms. The changes in the shape of the kernel function may be described in terms of the variations in the value of the lag, defined as the time difference between centroids of input and output. Using the lag as a basis for the dimensionless plotting of the kernel function leads to a curve that is nearly constant for all storm events in a given watershed. It is possible to obtain a good fit to observed floods and to predict future floods. (Knapp-USGS)
W73-15037

ANALYSIS OF UNITGRAPH METHOD OF FLOOD SYNTHESIS BY SHALLOW WATER EQUATIONS,
Geneva Coll., Beaver Falls, Pa. Dept. of Engineering.
C. A. Givler.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 145-156, 1973. 4 fig, 6 ref.

Descriptors: *Unit hydrographs, *Hydrograph analysis, *Rainfall-runoff relationships, Model studies, Mathematical models, Peak discharge, Streamflow forecasting, Flood forecasting.

The rainfall excess-surface runoff process was simulated by a deterministic watershed model consisting of a plane and channel. A numerical solution of the one-dimensional shallow water equations describes both plane and channel flows. The relationship between rainfall excess and surface runoff is nonlinear, with the degree of nonlinearity varying throughout the extent of the hydrograph. Because of nonlinearity, a watershed has no unique unitgraph. The unitgraph peak is proportional to the 0.40 power of input intensity and the -0.38 power of time to peak. The recorded unitgraph is obtained directly from simple streamflow records, while the derived unitgraph is calculated from complex events with the superposition principle. For simulating floods the derived unitgraph tends to be more accurate because it inherits a bias toward the superposition principle. The unitgraph can lead to serious errors in flood simulation. It is recommended that the standard unitgraph method be refined by the unitgraph adjustment technique and the multiple unitgraph technique. (Knapp-USGS)
W73-15038

DEMONSTRATION OF NONLINEAR EFFECTS OF A SECOND ORDER SURFACE RUNOFF MODEL BY FIELD DATA,
Armament Development Authority, Haifa (Israel).
A. Boneh, and M. H. Diskin.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 157-166, 1973. 4 fig, 7 ref.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, Unit hydrographs, Peak discharge.
Identifiers: Volterra series.

Indications of nonlinear behavior of watersheds are common analyses of rainfall and runoff data, especially from small watersheds. Unit hydrographs derived from storms of higher intensity (for the same short duration) have a higher peak and a shorter time to peak. A useful nonlinear representation of the rainfall-runoff relationship is a second order Volterra series. The second order model is characterized by two kernel functions that specify the system considered. Some properties of the two kernel functions may be derived from the nature and definition of the surface runoff system. Other properties are consequences of the behavior of small watersheds. (Knapp-USGS)

LONG TERM RUNOFF ANALYSIS BY A CONCEPTUAL PHYSICAL MODEL,
Kyoto Univ. (Japan). Disaster Prevention Research Inst.
M. Kadoya, and Y. Hayas.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 200-212, 1973. 8 fig, 4 ref.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, *Hydrograph analysis, Base flow, Time lag, Recharge, Subsurface runoff, Systems analysis, Flood forecasting, Runoff forecasting.
Identifiers: Kinematic wave theory.

Simulating the long-term runoff hydrograph at the outlet of a watershed by a simple method is based on the assumption that long-term runoff phenomena are the combination of repetitions of short-term runoff and addition of groundwater flow with a long time-constant. These may be simulated by adopting theoretical models combining all the other short- and long-term runoff models. Three conceptual models were constructed considering the physical mechanism of the runoff phenomena: (1) the recharge capacity model for groundwater runoff and rainfall loss for direct runoff; (2) the interflow model for the flow in porous media on the surface of slope; and (3) the kinematic wave model for overland flow. The usefulness of combining the models using theoretical relationships between them is emphasized through an applied example. (Knapp-USGS)

STOCHASTIC MODEL OF FLOOD RISK EVALUATION,
West Virginia Inst. of Tech., Montgomery. Dept. of Civil Engineering.
A. S. Paintal.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 343-348, 1973. 4 ref.

Descriptors: *Statistical models, *Flood forecasting, *Risks, Probability, Stochastic processes, Design flood, Design flow, Peak discharge.

A stochastic model is given for use in making hydrologic decisions involving floods. The flood events (in excess of given magnitude) occurring along the time axis are assumed to be independent of each other. The distribution function of damage caused by a given flood is a negative exponential. A mathematical expression for the density function of total damage during the life of structure is based on the theory of sums of a random number of random variables and on Bayesian probability concepts. CLIMATOLOGICAL NOTES OF 1972 - MINNESOTA,
Minnesota Univ., St. Paul. Dept. of Soil Science.
D. G. Baker.
Available from the National Technical Information Service as PB-223 909, $3.75 in paper copy, $1.45 in microfiche. In: A Report on Field Research in Soils, Soil Series 89. Department of Soil Science, University of Minnesota. p 1-25, March 1973. 7 fig, 5 tab. OWRR B-068-MINN (1). 14-31-0001-3901.

Descriptors: *Climate, *Minnesota, *Precipitation (Atmospheric), Temperature, Soil moisture.
Identifiers: *Phenological observations.

The year 1972 shall be long remembered as one of the coldest years, a summer with many flash floods and a 'month without the sun.' The year was the coldest since 1917; Minneapolis-St. Paul mean temperature in 1917 was 40.6 degrees and for 1972 - 41.3 degrees. Flash floods occurred in every month from May through September. The month of November received the least amount of sunshine of any month since sunshine records began. Yet the year can be classified as a quiet and peaceful year with respect to severe storms. There were only five tornadoes, compared with the normal of 17 per year, and all five were weak and caused little damage. Also there were less than the average number of damaging hail, wind and snow storms during the year. (Walton-Minnesota)

Identifiers: USSR, Hydrosphere.

A number of problems relating to the hydrologic cycle in the atmosphere and hydrosphere are discussed. Relations of heat and water balances of the earth's surface and of precipitation (amount, intensity, frequency) to atmospheric moisture, temperature, and relative humidity are analyzed. Studies are made of dispersion of water vapor in the atmosphere and of possibilities of a climatological forecast of precipitation and changes in the hydrologic cycle. (Josefson-USGS)

PROBABLE MAXIMUM PRECIPITATION--THE CONCEPT, CURRENT PROCEDURES, AND OUTLOOK,
National Weather Service, Silver Spring, Md. Office of Hydrology.
J. F. Miller.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 50-61, 1973. 2 fig, 17 ref.

Descriptors: *Probable maximum precipitation, *Flood forecasting, Meteorology, Model studies, Planning, Weather data.

The basic procedure in preparing probable maximum precipitation estimates is the adjustment of precipitation values from observed storms for maximum moisture. The analyzed precipitation values for these storms are adjusted by a ratio between the maximum moisture observed over the problem basin and the moisture observed in each storm. The moisture content in both the maximum observed and the storm case is usually estimated from surface dew points. This moisture content is commonly called precipitable water, which is defined as the total atmospheric water vapor in a vertical column of unit cross-sectional area between any two specified levels. These methods and procedures have produced answers that seem to be reasonable estimates of what nature can ultimately produce. As knowledge of the atmosphere increases and ability to model the atmospheric processes increases, we will be increasingly able to make use of a modeling procedure in the field of hydrometeorology. Any dynamic model that is to be useful in this field must reproduce not only the average afternoon thunderstorm or general rain situation but also the extreme events that have occurred. (Knapp-USGS)

A PROPOSAL FOR ESTIMATING TROPICAL STORM PROBABLE MAXIMUM PRECIPITATION (PMP) FOR SPARSE-DATA REGIONS,
National Weather Service, Silver Spring, Md.
F. K. Schwarz.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 62-82, 1973. 9 fig, 24 ref.

Descriptors: *Probable maximum precipitation, *Synoptic analysis, Satellites (Artificial), Weather forecasting, Tropical cyclones, Weather patterns.

Generalized hemispheric-wide estimates of probable maximum precipitation, (PMP) are superior to estimates made by means of a piecemeal, nation-by-nation, approach. With emphasis on synoptic type, some areas of expected PMP control by the tropical storm type are outlined. PMP potential was determined along selected coasts to demonstrate a specific application of a hydrometeorological procedure. Careful and full use of satellite data plays a key role in the solution of the variations in tropical storm PMP. Both empirical and theoretical evidence now exist relating hurricane intensity to the magnitude of the upper-level cloud canopy. The maximum windspeed could thus be estimated from the satellite picture of the cloud system. The intensity of the upper-level airflow is a good estimate of storm intensity. (Knapp-USGS)

HYPOTHESES ON THE SEASONAL DISTRIBUTION OF THUNDERSTORM RAINFALL IN SOUTHEASTERN ARIZONA,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
L. J. Lane, and H. B. Osborn.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 83-94, 1973. 2 fig, 2 tab, 19 ref.

Descriptors: *Rainfall, *Variability, *Runoff forecasting, *Streamflow forecasting, Rainfall disposition, Probability, Rain gages, Statistics, Statistical methods, *Arizona.
Identifiers: Bernoulli equations.

In much of southern Arizona, thunderstorm rainfall is the most important source of water. Thus, estimates of thunderstorm rainfall are important in decisions concerning water supplies and water resource system design. Extreme flood events on small (100 square miles and less) semiarid watersheds in southern Arizona are due to air-mass thunderstorm rainfall. A single gage is not sufficient to measure thunderstorm rainfall on the 58-square-mile Walnut Gulch watershed. The occurrence of significant storms during the summer rainy season may be modeled as a Bernoulli random variable. Equations are presented for the mean and variance of the number of rainy days for two hypotheses concerning the variability of the Bernoulli parameters during the season. The first hypothesis is that the parameters are constant throughout the variable season. In this case, the distribution of rain is compound, and the distributions of the number of events in fixed subintervals is binomial. Under the second hypothesis, there is strong seasonality with considerable variations of the parameters. Short records are inadequate to decide in favor of either hypothesis. The normal distribution is an excellent approximation to the distribution of the number of events per season. (Knapp-USGS)

UNPREDICTABILITY OF HYDROLOGIC DROUGHTS,
Colorado State Univ., Fort Collins
P. Torranin.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 595-604, 1973. 3 fig, 6 ref. NSF Grant GK-11564.

Descriptors: *Droughts, *Weather forecasting, Correlation analysis, Water temperature, Precipitation (Atmospheric), Hydrologic cycle, Pacific Ocean, *Forecasting.

The feasibility of long-range prediction of continental droughts was investigated by using multiple-lag cross-correlation analysis. The analysis was based on 21 years of monthly precipitation data of three large areas of the west coast of the United States and of monthly sea surface temperature of 29 areas of the adjacent Pacific Ocean. Although there is a statistically significant lag cross-correlation between the monthly coastal precipitation in summer and the sea surface temperature, the correlation is not sufficiently high to use sea temperature to predict the coastal monthly precipitation. For the same significance level and the same number of independent variables used, sampling distribution of the stepwise multiple correlation coefficient obtained by an experimental data generating technique shows a higher significance value of the multiple correlation coefficient than those obtained when the independent variables are randomly selected. TEMPORAL AND SPATIAL VARIATION OF PARAMETERS FOR THE DISTRIBUTION OF N-DAY PRECIPITATION,
Agricultural Research Service, Fort Collins, Colo.
D. A. Woolhiser, E. Rovey, and P. Todorovic.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 605-614, 1973. 3 fig, 2 tab, 8 ref.

Descriptors: *Rainfall, *Weather forecasting, *Stochastic processes, *Time series analysis, Statistical models, Distribution patterns, Probability, *Colorado, Droughts.

A stochastic model of n-day rainfall is structured such that the number of rainy days in an n-day period is described by a Markov Chain and the amount of rainfall per day is exponentially distributed. Parameters for this model were estimated for 7- and 21-day intervals at 11 eastern Colorado stations. The time variations of the parameters were fitted using a finite Fourier series and the spatial variation was accounted for by maps of the annual mean value. Such mean value maps along with a set of normalized Fourier coefficients provide a regionalized model of n-day precipitation. This model has several important advantages over the currently used gamma distribution and provides equally good fits to observed distributions. (Knapp-USGS)

escriptors: *Droughts, *Statistical models, Stochastic processes, Time series analysis, Hydrologic data, Weather forecasting, Climatology.

ritical drought durations may be modeled at a patial point in a given time interval from considerations on extreme values of a random number f droughts. Specifically, two aspects of droughts ere examined: (a) the maximum drought duration xpected within a given time interval (for example, crop season), and (b) the length of time we must ait to experience a drought that exceeds a preassigned critical duration. This approach requires little data for validation, may be transferred from ne point to another, and may be extended to duation of areal drought within a given time interval. A STUDY OF THE FREEZING CYCLE IN AN ALASKAN STREAM,
Alaska Univ., College. Geophysical Inst.
C. S. Benson.
Available from the National Technical Information Service as PB-223 905, $3.00 in paper copy, $1.45 in microfiche. Alaska Institute of Water Resources, College, Report IWR-36, March 1973. 31 p, 2 fig, 2 tab, 14 ref, append. OWRR A-012-ALAS (1).

Descriptors: *Ice cover, Streams, *Winter, *Alaska, *Freezing, Crystal growth, Water temperature, Ice, Supercooling, Spring, Thawing, Melt water, Streamflow, Floods.
Identifiers: *Stream freezing cycle.

The summer history of arctic and subarctic streams has received considerable attention. This is especially true for glacier streams. But these streams also have an interesting winter history which has been largely ignored. Goldstream Creek, at the Alaskan research site, is about 8 m wide and, prior to freezeup in October, it varies from 20 to 40 cm deep across the main test section. During the last 3 weeks prior to formation of a complete surface ice cover, the water temperature varies within a range of about 0.2C. Early in the nightly cooling cycle it drops to -0.01 to -0.05C for periods of several minutes up to several hours. Discs of frazil ice, 1 to 6 mm in diameter and 0.025 to 0.1 mm thick, form in the supercooled water and gradually raise its temperature to near 0C. At this stage, dendritic forms begin to grow on the discs. These adhere to the stream bottom and crystals continue to grow as turbulent flow of slightly supercooled water transports the heat of fusion to the stream's surface, where it is lost as long-wave radiation or by advection or evaporation. This process produces underwater ice. During breakup, in May, the streambed was always full of ice and the overflowing floodwaters peeled off the ice layers. (Woodard-USGS)

STATISTICAL COMPARISON OF AIRBORNE LASER AND STEREOPHOTOGRAMMETRIC SEA ICE PROFILES,
Naval Oceanographic Office, Washington, D.C. Polar Oceanography Div.
S. G. Tooma, Jr., and W. B. Tucker.
Remote Sensing of Environment, Vol 2, No 4, p 261-272, 1973. 11 fig, 2 tab, 9 ref.

Descriptors: *Sea ice, *Topography, *Remote sensing, *Photogrammetry, Statistics, Statistical methods, Correlation analysis, Profiles, Data collections, Surveys, Mapping.
Identifiers: *Lasers, *Lincoln Sea.

During August 1971 airborne laser profiling data and stereophotographs of sea ice were collected over the Lincoln Sea north of Greenland. A statistical comparison was made of the laser and stereophotogrammetric sea ice profiles collected on that mission. Laser and stereo profiles showed agreement in the elevations of identifiable features to approximately 23 cm. Fourier amplitude spectra derived from the profiles showed best agreement for surface wavelengths between 7.6 and 45.7 m, but was limited in part by the laser response time. Cross-correlations between profile records subjected to comb filters verified the indications of the amplitude spectra comparisons and showed cross-correlation coefficients as high as 0.83 for data of surface wavelengths of 6.1 to 91.4 m. A PATTERN OF MUSKEG--A KEY TO CONTINENTAL WATER,
New Brunswick Univ., Fredericton. Muskeg Research Inst.
N. W. Radforth, and D. J. Bellamy.
Canadian Journal of Earth Sciences, Vol 10, No 9, p 1420-1430, September 1973. 24 fig, 1 tab, 19 ref, append.

Descriptors: (*Permafrost, *Muskeg), *Hydrogeology, Swamps, Tundra, Wetlands, Bogs, Marshes, *Peat, *Canada, Surface-groundwater relationships.
Identifiers: Hydroform.

The relationships between the airform pattern, hydrology, and history of the muskegs of Canada were studied. A new interpretive classification based on the concept of hydroform is proposed and some practical examples of its application are given. All peat is initiated within some landscape feature that possesses a certain water-holding capacity (surface retention). The developing peat modifies the surface retention producing a recognizable landscape feature. The term hydroform is proposed to contain the concept of the interaction. The presence of tall trees shows that a state of development has been reached in which drying of the surface peat occurs, thus indicating that the peat reservoir effect is reaching a maximum for that site and that template condition. Within the zone of continuous permafrost each cover type is related to certain potential maximum depth to permafrost. Within smaller areas, this relationship allows accurate assessment of the permafrost conditions within the hydroform. (Knapp-USGS)

APPLICATION OF THE GRID SQUARE TECHNIQUE TO MAPPING OF EVAPOTRANSPIRATION,
Exeter Univ. (England). Dept. of Geography.
A. M. Foyster.
Journal of Hydrology, Vol 19, No 3, p 205-226, July 2973. 14 fig, 30 ref.

Descriptors: *Mapping, *Evapotranspiration, Runoff, Precipitation (Atmospheric), *Computer programs, Water balance, *Data processing, Hydrologic data, *Climatic data, Networks, Meteorological data.

A method of producing potential evapotranspiration maps for a part of southwest England uses grid-based extrapolation. Penman's equation was chosen to estimate potential evapotranspiration because it uses readily available climatic data and it produces estimates that closely resemble evaporation pan or lysimeter readings. A computer-oriented technique in association with grid data provides the best solution. A grid approach not only simplifies the production of maps but also facilitates data storage, retrieval, and processing because each square is defined by a pair of Cartesian coordinates. The easy referencing quality of a grid also allows the processing of data from subgroups of squares. Data from topographic maps is used to assemble a physiographic data file for each grid square. This file is then used as a set of independent variables in multiple regression analysis in order to extrapolate the climatological data over a grid. In this way, a file of climatological data is set up for every grid square. Values of 2 theoretical meteorological parameters are derived for each square by substituting values of physiographic parameters and daily declination of the sun and the earth-sun radius vector, into Okanoue's equation. This formula gives values of maximum possible incident radiation and maximum possible sunshine hours. Penman's monthly potential evapotranspiration estimates are then calculated by applying Penman's formula to the climatic and meteorological information for each individual grid square. (Knapp-USGS)

SOIL WATER CONTENT BENEATH SUMMER--DORMANT AND SUMMER-ACTIVE SWARDS IN A SEASONALLY SEMI-ARID ENVIRONMENT,
Reading Univ. (England). Dept. of Agricultural Botany.

Agric Meteorol. Vol 10, No 4/5, p 349-363. 1972. Illus.
Identifiers: Arid lands, *Australia, Clover, Cocksfoot, *Evapotranspiration, Lucerne, Phalaris, Seasonal, *Soil water, Summer, *Swards, Transpiration.

Soil water content was measured, over a period of 2 1/2 yr at Canberra, Austrailia, beneath summer-active swards (close-spaced and wide-spaced lucerne), and beneath summer-dormant swards (Phalaris and cocksfoot with subterranean clover). The measurements were made fortnightly, using the neutron scatter technique, at 0.25 m intervals down to 1.5 m. Seaonal patterns of change in soil water content were similar beneath all swards, but the changes beneath close-spaced lucerne were less than those beneath wide-spaced lucerne or grass swards at 0.5-1.25 m depth. Seventy-five percent of the changes in soil water content beneath all swards occurred in the top 0.75 m of soil. At depths greater than 1.0 m, soil water contents remained constant, and soil water potentials were less than -15 bar beneath close-spaced lucerne; small changes (2% by volume) were recorded beneath other swards. Evapotranspiration (ET) from summer-active and summer-dormant swards was similar even during summer. Less than 15% of summer evapotranspiration was supplied from the soil water store, but 30% of evapotranspiration was supplied from the soil store during spring. Seventy-five percent of the variation in ET was accounted for by variation in rainfall; only a further 4 and 3%, respectively, were accounted for by variations in open pan evaporation and available soil water. The rate of water withdrawal was linearly related to soil water content at each soil depth, but at a given soil water potential, withdrawal was 4 times greater from the top 0.5 m of the soil than from soil deeper than 1.0 m.--Copyright 1973, Biological Abstracts, Inc.

PLANT MOISTURE STATUS EFFECTS IN ESTIMATION OF EVAPORATION BY A COMBINATION METHOD,
Commonwealth Scientific and Industrial Research Organization, Aspendale (Australia). Div. of Atmospheric Physics.
W. Shepherd.
Agricultural Meteorology, Vol 11, No 2, p 213-222, January 1973. 3 fig, 15 ref.

Descriptors: *Evaporation, *Moisture stress, *Plant tissues, *Potatoes, Measurement, Plant physiology, Moisture content, Water vapor, Leaves, Analytical techniques, Soil moisture, Water supply, Conduction, Agroclimatology.
Identifiers: Internal Conductance Formula.

Earlier attempts have been made to generalize combination-type evaporation formulae for use under conditions of restricted water supply. McIlroy (1968) formula employs a crop 'Internal conductance' factor which cannot be determined directly, but an investigation to relate this conductance to various indices of plant moisture status is described. First, relationships of this factor to the relative water content, tissue water potential and water vapor diffusion resistance of leaves were investigated for four potato crops. The regression relationships with least scatter, namely those with the relative water content of upper leaves, were employed to estimate internal conductances of three further potato crops under a range of atmospheric and soil moisture conditions. The estimates of evaporation bases on these values of conductance were significantly closer to measured values than estimates based on simple empirical relationships involving, for example, the ratio of actual to potential evaporation. (Bahre-Ariz.)

INTERACTIONS OF POTASSIUM CHLORIDE AND TWO ANTITRANSPIRANTS ON STOMATAL REGULATION IN ISOLATED LEAF EPIDERMAL STRIPS OF TEPHROSIA PURPUREA PERS,
Jodhpur Univ. (India). Dept. of Botany.
T. Mathur, and D. N. Sen.
Biochem Physiol Pflanz (BPP). Vol 163, No 3, p 316-319, 1972, Illus.

Descriptors: Chlorides, Epidermal, Interactions, *Leaf epidermal, Light, Membranes, Permeability, Potassium, Regulation, *Stomatal regulation, Strips, Tephrosia-Purpurea, Transpirants, *Antitranspirants.

Initially closed stomata in isolated leaf epidermal strips of T. purpurea opened when floated on distilled water in light but not in dark. Water-induced open stomata were closed down both by phenylmercuric acetate (PMA) and 8-hydroxyquinoline (8-HQ). Potassium chloride (KC1) induced the opening of stomatal aperature to a maximum in light but not in dark. KC1-Induced open stomata were completely closed down in PMA but partially in 8-HQ. The entry of K+ was limited in presence of PMA in guard cells, possibly the latter decreased the permeability of the membrane to solutes (KC1) more than 8-HQ.--Copyright 1973, Biological Abstracts, Inc.

PREDICTION OF NEAR-SURFACE DRIFT CURRENTS FROM WIND VELOCITY,
Hydronautics, Inc., Laurel, Md.
J. Wu.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY9, Paper 9995, p 1291-1302, September 1973. 4 fig, 18 ref, append. ONR Contract N00014-73-C-0091.

Descriptors: *Currents (Water), *Winds, *Drifting (Aquatic), Waves (Water), Equations, Froude number, Fetch.

A practical procedure is outlined for determining wind-induced drift currents near the free surface, at all fetches, from a single wind-velocity measurement. The wind stress is scaled according to the Froude number and the momentum flux of the wind is considered to be partitioned between the wave drag and the momentum flux of the current. Some coefficients involved in the procedure are derived from the available data; further studies are suggested to refine the present estimation. (Knapp-USGS)

SUBCRITICAL KINEMATIC FLOW IN A STABLE STREAM,
Agricultural Research Service, University Park, Pa. Northeast Watershed Research Center.
W. J. Gburek, and D. E. Overton.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY9, Paper 10026, p 1433-1447, September 1973. 2 fig, 2 tab, 12 ref, append.

Descriptors: *Subcritical flow, *Unsteady flow, *Non-uniform flow, *Waves (Water), *Flood waves, Flood forecasting, Flood control, Stage-discharge relations, Flow characteristics.
Identifiers: Kinematic flow.

An evaluation of the shallow water equations in the lower 6.9 miles of a stable, gently sloped tributary to the Susquehanna River showed subcritical kinematic flow. Although loops were suspected, single-valued rating functions within small statistical error were established at four points along the stream. Also, single Manning n-values with very small statistical error were established at each point. It was shown explicitly that use of a single-valued rating function does not permit simultaneous use of a single resistance coefficient. Use of a single resistance coefficient independent of stage will induce a loop rating function. This apparent inconsistency was resolved by reformulating the characteristic equations in terms of the exponent of a single-valued rating function. Therefore, for the special case of subcritical kinematic flows, streamflow synthesis may be accomplished without resort to extrapolation of uniform flow formulas to unsteady nonuniform flow. LOOD-VOLUME DESIGN DATA FOR MISURI STREAMS,
eological Survey, Rolla, Mo.
Skelton.
issouri Geological Survey and Water Resources, ater Resources Report 28, 1973. 28 p, 2 fig, 1 ate, 4 tab, 10 ref, append.

escriptors: *Flood data, *Flood frequency, Flood flow, *Streamflow, *Missouri, Flood currence interval, Water yield, Statistical ethods, Regression analysis, Equations, Flood rofiles, Gaging stations, Hydrologic data, Flood recasting.
lentifiers: Data for ungaged sites.

lood-volume-duration data for selected recurence intervals are tabulated for 111 continuous-ecord gaging stations in Missouri. By regression nalysis, regional flood-volume equations applicale to ungaged sites with drainage basins as small s 0.2 square mile were defined for the Plains and lateaus regions. Four basin characteristics lrainage area, mean basin elevation, mean ruoff, and soils infiltration index) were statistically ignificant in defining flood volumes; one or more f these variables is required in computing the quations. METHOD FOR ESTIMATING THE DIVERSION POTENTIAL OF STREAMS IN EASTERN MASSACHUSETTS AND SOUTHERN RHODE SLAND,
Geological Survey, Boston, Mass.
G. D. Tasker.
Journal available from Sup Doc, GPO, Washington, D.C. 20402 Price $2.75. Journal of Research of the U.S. Geological Survey, Vol 1, No 5, p 615-619, September-October 1973. 7 fig, 1 tab, 5 ref.

Descriptors: *Water yield, *Streamflow, forecasting, Planning, Water management (Applied), Stream gages, Water supply development, Water resources development, Discharge (Water), Water measurement, *Rhode Island, *Massachusetts.
Identifiers: *Diversion (Streams).

A simple method is proposed for estimating the probable magnitude and frequency of streamflow that is in excess of predetermined minimum streamflows required downstream in eastern Massachusetts and southern Rhode Island. Regional curves relate these annual volumes of streamflow excess to the average annual discharge and the median 7-day annual minimum flow of the site. Use of the curves is illustrated by a hypothetical example. (Knapp-USGS)

CHANGES IN FLOODFLOW CHARACTERISTICS OF A RECTIFIED CHANNEL CAUSED BY VEGETATION, JACKSON, MISSISSIPPI,
Geological Survey, Jackson, Miss.
K. V. Wilson.
Journal available from Sup Doc, GPO, Washington, D.C. 20402 Price $2.75. Journal of Research of the U.S. Geological Survey, Vol 1, No 5, p 621-625, September-October 1973. 5 fig, 1 tab, 2 ref.

Descriptors: *Mannings equation, *Roughness (Hydraulic), *Floods, *Vegetation effects, Discharge coefficient, Channel improvement, Channel flow, Channel morphology, Streamflow, Stage-discharge relations, *Mississippi.
Identifiers: Channel capacity.

Extreme changes in velocity, stage, and Manning's roughness coefficient were observed during the first year after canalization of Hanging Moss Creek at Jackson, Miss. Additional changes were observed during the following 8 years. The channel, constructed during the summer of 1963, had a 50-foot-wide bottom, 2:1 side slopes, and 12-foot depth. In March 1964, average velocities of 7.8 feet per second were measured at a 5 1/2-foot depth in the clean channel, and Manning's coefficient was computed to be 0.022. In October 1964 the average velocity was 3.2 fps at a 5 1/2-foot depth and Manning's coefficient was 0.045. The channel was then lined with fairly thick vegetation consisting of small willows, weeds, and grass. In October 1970 (summer foliage existing) the average velocity was 2.0 fps at a 5 1/2-foot depth and Manning's coefficient was 0.07. Willow trees, 8 to 10 feet high then lined the channel. In March 1971 (barren foliage), Manning's coefficent was 0.05. In March 1972 (barren foliage) Manning's coefficient was increased to 0.07. These observations indicate that the commonly used values of Manning's coefficient for channel rectification (0.02-0.03) are low and that the carrying capacity of earthen channels may be reduced 50% as a result of only 1 year's growth of vegetation and 70% as a result of 8 year's growth, the carrying capacity during summer foliage is approximately two-thirds the carrying capacity during barren winter foliage. (Knapp-USGS)

THE USE OF NEAR-INFRARED PHOTOGRAPHY IN THE ANALYSIS OF SURFACE MORPHOLOGY OF AN ARGENTINE ALLUVIAL FLOODPLAIN,
Texas Univ., Austin. Dept. of Geography.
D. Conway, and R. K. Holz.
Remote Sensing of Environment, Vol 2, No 4, p 235-242, 1973. 5 fig, 2 tab, 10 ref.

Descriptors: *Remote sensing, *Aerial photography, *Infrared radiation, *Mapping, *Flood plains, Alluvium, South America, Alluvial channels, Vegetation, Geomorphology, Terraces (Geologic), Data collections.
Identifiers: *Argentina.

The surface morphology of an alluvial floodplain was examined using near-infrared photographic imagery. Using plant vigor and biomass as principal signatures, features such as abandoned meanders, channel course change, and floodplain terraces could be clearly distinguished. Further, a chronological ordering of the stages of abandonment could be achieved through the recognition of distinctive vegetative patterns. The use of near-infrared imagery provides additional information to field studies of alluvial floodplains. Viewing the site from a distance gives an added perspective to the whole and the pattern of change, both spatial and temporal, can be interpreted through the medium of vegetation. The photograph also provides an important tool on which field based mapping can be recorded. (Knapp-USGS)

THOUGHTS ON THE DESIGN OF DESIGN FLOODS,
M. A. Benson.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 27-33, 1973. 11 ref.

Descriptors: *Flood forecasting, *Statistical methods, *Flood frequency, Statistics, Flood data, Floods, Maximum probable flood, Design, Planning.

Improvement in flood-frequency delineation can come about only through multistation analysis. Two alternative approaches along this line should pay large dividends to the researcher. The first is by relating flood magnitudes to characteristics of the hydrologic environment. The second is by statistical analysis of multistation data in a manner that takes advantage of the complete range of information in both time and space. Improvement of methods for determination of the rare flood is needed for design of major or critical structures. Present methods or concepts are not acceptable to the critical analyst. The uncritical acceptance of the present methods and their widespread use have fostered the illusion that satisfactory methods are available and have been a deterrent to the study needed to provide truly meaningful and sound procedures. Descriptors: *Peak discharge, *Flood forecasting, *Probability, Runoff forecasting, Hydrograph analysis, Design flood, Design flow, Hydrographs.
Identifiers: *Gradex method.

The distribution of extreme flood volume can be extrapolated using the distribution of extreme rainfall volume. The slope of the extreme rainfall distribution is called the Gradex. The unit of time selected for both volumes is approximately equal to the time base of the flood hydrograph from the watershed. The distribution of the extreme peak discharge is obtained by multiplying the flood volume by the observed average ratio of peak to volume. Thus the uncertainty about the time base of the hydrograph has a slight influence on the computed extreme discharge. A fixed interval of time is recommended to sample rainfall and flood volume rather than a variable interval selected to intercept the maximum volume. In the case of large seasonal variations of Gradex it is better to compute the probability of the peak for each

season. The product of the seasonal probabilities is the probability of the annual peak. (Knapp-USGS)

REMOVAL OF UNIT HYDROGRAPH OSCILLATIONS BY FILTERING,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
M. L. Kavvas, and E. F. Schulz.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 167-174, 1973. 3 fig, 3 ref. OWRR B-054-COLO (5).

Descriptors: *Unit hydrographs, *Hydrograph analysis, Computer programs, Flood forecasting, Peak discharge, Fourier analysis.

Unit hydrographs derived from recorded floods sometimes exhibit oscillations. These oscillations can be removed by filtering. The success of this procedure is explained by the fact that the watershed system behaves as a low-pass filter. Stable, nonoscillating unit hydrographs were calculated for several events. The procedure is quite practical since it needs a minimum amount of calculations and plotting of curves. The computer program for the line spectrum takes about 5 seconds of computer time for each event and uses less than 43,000 core spaces for computer storage. The main factor of the unit hydrograph oscillations is the sampling interval. Taking too small sampling intervals increases the data points taken from the original data function. However, it also brings the higher frequencies and their unwanted contributions. Taking too large intervals has the opposite effect, but the larger interval has the effect of decreasing the resolution of the rising limb, crest segment and the early part of the recession limb of the unit hydrograph. Therefore, it is necessary to find an optimum sampling interval which will give the most data points without violating the functions of a low pass filter. (Knapp-USGS)

FLOOD EVALUATION BY SOME DATA GENERATION TECHNIQUES,
Birmingham Univ., (England). Dept. of Civil Engineering.
N. T. Kottegoda.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 189-199, 1973. 6 fig, 2 tab, 9 ref.

Descriptors: *Flood forecasting, *Synthetic hydrology, Variability, Mathematical models, Peak discharge, Flood frequency, Statistics, Statistical models, Stochastic processes.

Data generation is proposed for the estimation of rare floods. All the information in daily mean flow data are used with close fitting probability functions and seasonal variations in parameters and distributions. The Johnson and Pearson families of distributions were investigated. A time limit of 5 days was adopted. Through interpolation, the use of hydrograph properties and pertinent statistics in historical data, a daily series is formed. For modeling the persistence in the data, a fourth order autoregressive model and a functional noise model were used. (Knapp-USGS)

INTEGRATED HYDROLOGIC AND SOCIETAL INTERACTIONS TO FLOODS AND DROUGHTS IN INDIA,
Madhya Pradesh Government Control Board for Major Projects, Bhopal (India).
D. R. Sikka.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 237-245, 1973. 2 tab.

Descriptors: *Floods, *Droughts, *Planning, Flood control, Flood protection, Warning systems, Water resources development, Data collections, Hydrologic.
Identifiers: *India.

Floods and droughts cannot be treated in isolation; they have to be parts of integrated development of water resources. Flood data and forecasts could save direct damages, but they could not provide the long term relief for which a comprehensive flood plain is essential. India is traversed by a large number of river systems and experiences seasonal floods. Sustained floods occur mainly during the southwest monsoon season in the months of July, August, and September. However, floods do occur during the month of October, and even though the frequency of floods in some parts of northeast and central India is much less than during monsoon months, their results are devastating due to high antecedent soil moisture conditions. LOG-PEARSON TYPE III AND GUMBEL ANALYSES OF FLOODS,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
B. M. Reich.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 291-303, 1973. 8 fig, 2 tab, 8 ref.

Descriptors: *Flood frequency, *Flood forecasting, *Flood data, Variability, Probability, Statistical methods, Statistics, *Pennsylvania.
Identifiers: Log-Pearson analysis, Gumbel analysis.

Annual flood series of 15 years or more from 83 Pennsylvania watersheds under 214 sq mi were analyzed by Log-Pearson and Gumbel curve fitting methods. The general character of flood frequency plots is described with examples. Gumbel estimates are far more stable, even from less than 20 years data. The response of practicing engineers to a questionnaire concerning the goodness of fitting observed flood records by these two and the Log-Gumbel method is presented. The most striking pattern from the evaluation was engineers' rejection of Log-Gumbel curves. For every watershed the Log-Gumbel was declared unacceptable by at least one judge. The Log-Gumbel frequency curve generally seems unrealistically high beyond about 25-year return period. Log-Pearson Type III curves had the best weighted sum score in 42 of the 84 series. The Gumbel straight-line distribution was declared highly satisfactory in almost as many evaluations as was the LP III. (Knapp-USGS)

BEST FITTING OF PROBABILITY FUNCTIONS TO A SET OF DATA FOR FLOOD STUDIES,
Consiglio Nazionale delle Ricerche, Rome (Italy). Inst. for Water Research.
G. Cicioni, G. Giuliano, and F. M. Spaziani.

In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 304-314, 1973. 2 fig, 2 tab, 11 ref.

Descriptors: *Flood frequency, *Flood forecasting, Statistical methods, Statistics, Flood data, Variability, Probability.
Identifiers: *Italy.

Probability functions were evaluated for best fit in annual flood series. The following probability functions are considered: two-parameter log-normal distribution, three-parameter log-normal distribution, two-parameter Gamma distribution, Pearson Type III distribution, and extreme value Fisher-Tippett distributions. The maximum likelihood method was used for estimating the distribution parameters from the observed data. Goodness of fit was evaluated by some parametric and nonparametric statistics. The application to a set of over 100 stations in Italy is discussed. On the basis of fitting evaluation as well as physical constraints on variables range, the two-parameter log-normal distribution seems to be the most suitable for describing the set of annual flood series. (Knapp-USGS)
W73-15050

RELIABILITY OF ESTIMATES OF THE EXCEEDENCE PROBABILITY OF A GIVEN FLOOD MAGNITUDE,
Washington Univ., Seattle. Dept. of Civil Engineering.
S. J. Burges.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 315-324, 1973. 2 fig, 5 tab, 10 ref.

Descriptors: *Flood frequency, Decision making, *Simulation analysis, Flood data, *Probability, Variability, Stochastic processes, Flood recurrence interval, Flood forecasting, *Risks.

Two 3-parameter lognormal populations representing the range of variability in annual flood peaks normally encountered are used to demonstrate uncertainty experienced when estimating flood exceedence probabilities from samples typically containing 20 to 50 flood events. For situations requiring accurate estimates of flood events having exceedence probabilities smaller than 2%, record lengths much greater than those available are required. Uncertainty can be greatly reduced by simulating a very long sequence of floods from stochastically generated precipitation. Expenditure required to achieve reduction in uncertainty can be determined by employing decision analysis techniques. (Knapp-USGS)
W73-15051

A NEW PROPOSAL FOR COMPUTATION OF FLOOD FREQUENCY,
Bundesanstalt fuer Gewasserkunde, Coblenz (West Germany).
H. G. Mendel.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 325-333, 1973. 1 fig, 3 tab, 8 ref.

Descriptors: *Flood frequency, *Flood data, *Probability, Variability, Statistical methods, Flood recurrence interval, Flood forecasting.

One advantage of the commonly used flood frequency distributions is that, analytically, they are of very simple construction, allowing the immediate determination of the return period if the empirical distribution is known. However, these distributions, including Extremal I (Gumbel), Pearson III (Foster), Log Pearson III, Fuller, Fechner and Normal, involve the great disadvantage of insufficient flexibility; their adaptation to the empirical distribution derived from the available sample is frequently inadequate. Mathematical tests are required as selection criteria. The Generalized Gamma Distribution is extremely well suited for determining flood frequency from a sample. For arid or semiarid areas (combination with Fuller's law), this distribution may yield a double peak distribution with a positive probability for zero discharge. At higher discharges, Extremal Type I, Pearson III and Log Pearson III fall outside the empirical distribution. (Knapp-USGS)

RISKS FROM USING INADEQUATE FLOOD RECORDS,
Asian Inst. of Tech., Bangkok (Thailand). Dept. of Hydraulic Engineering.
S. Pinkayan, and P. Premchun.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 334-342, 1973. 3 fig, 1 tab, 9 ref.

Descriptors: *Flood data, *Data collections, Statistical methods, Variability, Probability, *Risks, Design flood, Hydrologic data.
Identifiers: Inadequate hydrologic data.

Risks and uncertainties are always associated with the estimated magnitude of a design flood determined from a certain period of flood records. These risks depend upon the number of flood events used in the estimation. The extreme value distribution of type I was used to describe the annual floods of northern Thailand. The parameters a and b of the distribution were estimated from the record. Student's t distribution was used to estimate the population parameters of the distribution. For the same value of flood magnitudes, two different return periods were calculated from the two sets of parameters. The difference between these two return periods define the risks of the flood estimation. The general characteristics of risks are described as a function of the number of years of record and the return period. A minimum period of flood records is recommended on the basis of structure life, encounter probability, and allowable risks. (Knapp-USGS)

OBJECTIVE REGIONALIZATION OF PEAK FLOW RATES,
Agricultural Research Service, Chickasha, Okla. Soil and Water Conservation Research Div.
D. G. De Coursey.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 395-405, 1973. 3 fig, 6 tab, 6 ref.

Descriptors: *Hydrologic data, *Peak discharge, *Flood forecasting, *Statistics, Estimating, Statistical methods, Flood data, Rainfall-runoff relationships, Regional analysis, *Oklahoma.
Identifiers: *Regionalization.

Hydrologic data must be estimated at many sites. Prediction equations based on regionalized data should be used to estimate such data. Regionalization is demonstrated using 4 peak flow rates and 12 watershed characteristics from 90 stations in Oklahoma. The 90 stations were divided into a base set of 60 stations and an independent test set of 30 observations. Stations in the base set were regionalized on the basis of similarity of hydrologic response using discriminant analysis and an iterative algorithm. The test set of 30 watersheds was classified into the 3 groups using discriminant functions. Peak rates were predicted using linear multiple regression equations based on the same set of watershed characteristics: drainage area, mean annual precipitation, and the 2- and 100-year precipitation intensity. The peak rates of the 30 independent stations were also predicted using conventional stepwise regression equations that had been developed from the base set of 60 observations. Comparison of the two schemes showed that prediction from regionalized data had a consistently smaller standard error of estimate and that the use of the same watershed characteristics in the prediction of all four peaks led to a much better hydrologic continuity than using the conventional stepwise regression technique to develop the prediction equation for each peak rate independently. SOME METHODS FOR ESTIMATION OF FLOODS IN A TROPICAL AREA,
World Meteorological Organization, San Jose (Costa Rica). Central American Hydrometeorological Project.
E. Basso.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 406-417, 1973. 6 fig, 3 tab, 7 ref.

Descriptors: *Flood forecasting, *Rainfall-runoff relationships, *Rational formula, Equations, Time of concentration.
Identifiers: *Central American Isthmus, Costa Rica.

Estimation of floods in the Central American Isthmus is difficult because of lack of long and reliable discharge records. For 33 small basins, up to 250 sq km in area, the concentration time can be estimated. Previous soil conditions do not significantly change these results. Rainfall envelopes for the area are shown and compared with information from other areas. A flood envelope for the Central American Isthmus obtained by the Central American Hydrometeorological Project is presented and is compared with similar curves resulting from the application of the rational method. (Knapp-USGS)

WATERSHED FLOOD ROUTING USING DISTRIBUTED PARAMETERS,
Agricultural Research Service, Brookings, S. Dak.
C. A. Onstad.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 418-428, 1973. 3 fig, 2 tab, 16 ref.

Descriptors: *Flood routing, *Flow nets, *Routing, Overland flow, Infiltration, Roughness (Hydraulic), Open channel flow, Wetting.
Identifiers: Kinematic wave theory.

A method for considering distributed input parameter distribution is based on flow net theory. Contour lines on a watershed topographic map are considered to be equipotential lines. Streamlines are constructed normal to the contour lines. The result is a collection of incremental units, each assumed to be homogeneous, representing the natural sequence of the watershed drainage network. Each incremental unit starting with rainfall is computed using the Green and Ampt model for infiltration into layered soils and the kinematic flow equations for routing overland and channel flow. In this manner, hydrographs can be calculated at any desired location on the watershed itself or in the channel. The parameters required for each incremental unit in addition to its geometry are the hydraulic roughness of the surface and the thickness, the bulk density, the saturated hydraulic conductivity, the initial moisture condition, and the pressure head characteristic at the wetting front for each layer in the soil profile. Channel and reach geometry together with hydraulic roughness are the input parameters necessary for channel routing using the kinematic formulation. (Knapp-USGS)

SIGNIFICANCE OF THE GENESIS OF FLOODS ON PROBABILITY ANALYSIS,
Ebasco Services, Inc., New York.
B. S. Browzin, C. A. Baumbusch, and M. G. Pavlides.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 450-461, 1973. 2 fig, 1 tab, 13 ref.

Descriptors: *Floods, *Time series analysis, *Probability, *Flood forecasting, Meteorology, *Texas, Statistics, Statistical methods, Variability, Duration curves, Flood data.
Identifiers: *Flood probability.

The rainfall floods of different meteorological origin (caused by tropical cyclones, by squall-line thunderstorms, or by collision of cool air with warm moisture-laden air) are of different character and might not form a homogeneous series susceptible to probability flood analysis. Particular types of precipitation may belong to specific seasons. Texas floods were studied in this respect. Major floods occur on Texas rivers in the spring and the fall. The spring and fall floods may have different genesis. Different conditions of the terrain which may exist in the spring and in the fall could further contribute to modify the character of floods. Consequently, if the annual flood series is used, the series may not be homogeneous. Probability analysis based on the fall, spring, and annual series revealed that the floods predicted on the basis of seasonal series are larger than those based on the annual series. Consequently, the genesis of rainfall floods should be considered as a factor in choosing the data for the flood series for probability analysis in certain regions. (Knapp-USGS)

FLOOD CHARACTERISTICS OF THE RAMU RIVER, NEW GUINEA,
Papua and New Guinea Inst. of Tech., Lae (New Guinea). Dept. of Civil Engineering.
E. M. Laurenson.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 462-476, 1973. 7 fig, 1 tab, 4 ref.

Descriptors: *Floods, *Rainfall-runoff relationships, *Channel morphology, Flood plains, Meanders, Tropical regions, Wet climates, Variability, Hydrograph analysis, Unit hydrographs, Flood frequency.
Identifiers: *New Guinea (Ramu River).

The climate of New Guinea, which lies close to the Equator and outside the area subject to tropical cyclones, exhibits both an unusually high degree of uniformity from year to year and unusually high variability from point to point. These characteristics are particularly evident on the Ramu River catchment, whose extremely flat flood frequency curve is contrasted with an extremely steep one for the Namoi River in New South Wales. These characteristics make the use of the unit hydrograph method and the enveloping curve method of flood estimation difficult but at the same time render the use of flood frequency studies more reliable. River channel cross sections in sinuous and meandering sections of the Ramu River are compared. The stability of the sinuous section of channel is explained by its low channel capacity. A cross section of the flood plain clearly demonstrates the existence of natural levees, and the implications of these for bridge backwater computation are discussed. (Knapp-USGS)

STOCHASTIC STRUCTURES IN SPACE AND TIME OF DAILY PRECIPITATION AND THEIR SIMULATION,
Kyoto Univ. (Japan). Dept. of Civil Engineering.
T. Ishihara, and S. Ikebuchi.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 615-626, 1973. 5 fig, 3 tab, 2 ref.

Descriptors: *Runoff forecasting, *Stochastic processes, *Simulation analysis, Statistical models, Rainfall-runoff relationships, Data collections, Gaging stations, Hydrologic data, Droughts.
Identifiers: *Japan (Yodo River basin).

For the development and utilization of water resources, especially in droughts, it is necessary to establish techniques for long-range runoff simulation. Since precipitation has regional and seasonal fluctuations, there is a need for a long record and for many stations. Stochastic structures in space and time are estimated from their interrelations; these include regional correlation analysis between the base station and the surrounding stations, spatial simulation between stations, and sequential simulation at the base station. Daily precipitation is predicted over a long period and a wide area. Areal daily precipitation may be estimated by the Thiessen method. The results applied to the Yodo River basin in Japan adequately represent the characteristics of observed data. Furthermore, the runoff data combined with the basin system model agrees well with stream records. (Knapp-USGS)

STATISTICAL PROPERTIES OF RUNS AS APPLIED TO HYDROLOGIC DROUGHTS,
Colorado State Univ., Fort Collins.
J. Millan.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 627-636, 1973. 1 fig, 1 tab, 10 ref. NSF Grant GK-11564.

Descriptors: *Droughts, *Statiistics, *Probability, Markov processes, Time series analysis, Claimatology, Distribution patterns, Water shortage, *Streams.

A method is presented for computing the probability distribution of droughts based on runs. The longest negative run length and the largest negative run sum are used as basic parameters. The probability distribution of the length of the longest run of one kind is determined exactly for the case in which the series of surplus and deficits can be described by a Markov Chain. The degree to which this result approximates the case of an observed time series described by a first-order autoregressive model was determined. Experimental methods were used to verify a hypothesis extending the results to the case of a truncation level in the form of a linear trend and to determine an empirical fitting to the distribution of the largest run sum. STORM-GENERATED CURRENT IN LA JOLLA SUBMARINE CANYON, CALIFORNIA,
Scripps Institution of Oceanography, La Jolla, Calif.
F. P. Shepard, and N. F. Marshall.
Marine Geology, Vol 15, No 1, p M19-M24, August 1973. 2 fig, 11 ref.

Descriptors: *Currents (Water), *Continental shelf, *California, *Turbidity currents, *Storm surge, Winds, Velocity, Submarine canyons.
Identifiers: *La Jolla Submarine Canyon (Calif).

Current meters were operating in La Jolla Submarine Canyon at 200 m depth during a period of high seas and onshore winds up to 62 km/h. The records show a downcanyon speed up to 50 cm/sec, considerably higher than any earlier measurements. This was followed by an abrupt termination of data, evidently due to the meters being engulfed in seaward-moving kelp masses. The record may provide evidence of the initial stages of a turbidity current. The conditions for such a current were provided by the piling up of water at the canyon head by the unusually strong onshore wind. (Knapp-USGS)

NO CURRENT REVERSAL AT 10,000 B.P. IN THE STRAIT OF GIBRALTAR,
Kiel Univ. (West Germany). Geologisch-Palaeontologisches Institut und Museum.
L. Diester-Haass.
Marine Geology, Vol 15, No 1, p M1-M9, August 1973. 3 fig, 1 tab, 17 ref.

Descriptors: *Currents (Water), *Bottom sediments, *Sedimentation, Ocean circulation, Stratigraphy, Deposition (Sediments), Paleohydrology, Sedimentary structures, Sediment sorting, Particle size.
Identifiers: *Mediterranean Sea.

Two cores were taken west of Gibraltar within the region of recent current influence of Mediterranean bottom outflow. A coarse-fraction analysis was made in order to see if current influence occurs in the lutitic sediments and whether there has been a change in current systems. In most parts of the cores, the curves of median diameters of planktonic and benthonic foraminifers are parallel. The sediments are sorted by the Mediterranean bottom outflow, which reduces sedimentation of small sand-sized particles. In some core sections there is no sorting. Sorting and nonsorted layers are contemporaneous in the two cores. Current reversal in Holocene and Late Pleistocene, from 10,000 to 17,000-21,000 years B.P., is most unlikely. The two nonsorted layers in the lower core sections (17,000-21,000 to 34,000-46,000 years B.P.) may have been produced by current reversals or by a northerly shift of the Mediterranean bottom outflow in the Bay of Cadiz. Journal of Hydrology, Vol 19, No 4, p 323-349, August 1973. 15 fig, 2 tab, 32 ref.

Descriptors: *Tracers, *Groundwater movement, *Karst hydrology, Limestones, Dye releases, Karst, Hydrogeology, Surface-groundwater relationships.
Identifiers: *England.

Two experiments were conducted in the Carboniferous Limestone aquifer of the Mendip Hills, Somerset, to compare the relative merits of differing groundwater tracers. The tracers employed were lithium acetate, polyethylene powder, Lycopodium spores, and the fluorescent dye Pyranine; all were introduced into the aquifer at stream sinks. Lithium acetate and polyethylene powder were totally unsuccessful. The rates of travel of the fluorescent dye and Lycopodium spores were very similar. Absolute concentration for dye can be determined using a field continuous flow fluorometer. The quantitative dye concentration data can be used with simultaneous measurements of discharge at the spring to deduce the flow geometry of the system; the input, tributary, distributary and maximum discharges in the system; and the volume of the underground conduits. Exchange takes place between the flooded conduit and the surrounding fissured bedrock in a manner analogous to bank storage in rivers flowing on alluvium. (Knapp-USGS)

VALIDITY OF DUPUIT-FORCHHEIMER EQUATION,
Lehigh Univ., Bethlehem, Pa. Dept. of Civil Engineering.
W. A. Murray, and P. L. Monkmeyer.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY9, Paper 9997, p 1573-1583, September 1973. 4 fig, 16 ref, append.

Descriptors: *Dupuit-Forchheimer theory, *Groundwater movement, *Slopes, Equations, Drawdown, Water yield, Mathematical studies, Aquifers.

The Dupuit-Forchheimer equation describing unconfined groundwater flow is limited by the underlying assumptions inherent in its derivation. A validity criterion developed from an analysis of the exact equations of motion shows that, in general, the Dupuit-Forchheimer equation describes a rising water table more accurately than a falling one. In the steady state the criterion reduces to a simple restriction on the free surface slope. For unsteady flow, the criterion involves both the free surface slope and the rate of change of the free surface position. The free surface slope must be no greater than 1:10 if results are expected to be within 1% of exact. More accurate results should be obtained by using data from either a recharging well or the recovery period after pump shutdown rather than drawdown data. (Knapp-USGS)

INSTRUMENTATION FOR MEASUREMENT OF BEACH WATER-TABLE FLUCTUATIONS,
Virginia Inst. of Marine Science, Gloucester Point.
J. D. Boon, III, and W. Harrison.
In: Investigation of the Water Table in a Tidal Beach; Virginia Institute of Marine Science Special Scientific Report No 60, p 1-14, October 1971. 8 fig, 1 ref.

Descriptors: *Water table, *Water levels, *Water level fluctuations, *Instrumentation, *Beaches, Gages, Telemetry, Data collections, Groundwater, Tides, Floods, Storm surge, Infiltration.

A system for acquisition of water-level data from the water table of a sandy ocean beach consists of a slotted PVC well pipe with nonslotted upper section, housing a float and float wire, a galvanized steel pipe, housing a counterweight and counterweight line, and a float-gage system connected to a precision potentiometer. A low-voltage power source connects to the potentiometer which gives an output corresponding to the elevation of the water table. The response of such a float-pulley system is accurate to plus or minus 3.0 mm, and it exhibits a high degree of precision. Details of fabrication and installation of the monitoring system are given. Selected portions of an analog

plot of output from 11 to 13 wells that operated continuously for 31 days are also presented. (See also W73-14985) (Knapp-USGS)
W73-14986

THE WATER TABLE AS A RESPONSE VARIABLE OF THE SYSTEM,
Virginia Inst. of Marine Science, Gloucester Point.
L. E. Fausak.
In: Investigation of the Water Table in a Tidal Beach; Virginia Institute of Marine Science Special Scientific Report No 60, p 15-42, October 1971. 13 fig, 4 tab, 14 ref.

Descriptors: *Water level fluctuations, *Water table, *Beaches, *Tides, *Waves (Water), Data collections, Sands, Instrumentation, Groundwater movement, Surface-groundwater relationships, Beach erosion, Sediment transport, Surf.

Fluctuations of the water table of a tidal marine beach over a 30-day period were examined. Variations in still-water level, swash runup distance, distance of a sampling station from the shoreline, and atmospheric pressure were determined for rising half-tide cycles in 13 water table monitoring wells spaced along a transect perpendicular to the shoreline. Tidal oscillations exerted the strongest influence in all except the two seawardmost wells and in the most landward well. Distance from the shoreline is the most important variable in the seaward wells because of decay of the input wave and the resultant large range of water-table fluctuations near the beach face. Atmospheric pressure is the dominant variable influencing water-table fluctuations in the most landward well, due to the relatively slight contribution of the tide and wave inputs. The amplitude of the water-table fluctuations decreases exponentially in a landward direction and the lag time of the input wave increases linearly with distance from the shoreline. The time lag is approximately 60 minutes per 18 meters of depth. (See also W73-14985) (Knapp-USGS)
W73-14987

CHANGES IN FORESHORE SAND VOLUME ON A TIDAL BEACH: ROLE OF FLUCTUATIONS IN WATER TABLE AND OCEAN STILL--WATER LEVEL,
Virginia Inst. of Marine Science, Gloucester Point.
W. Harrison.
In: Investigation of the Water Table in a Tidal Beach; Virginia Institute of Marine Science Special Scientific Report No 60, p 43-62, October 1971. 5 fig, 2 tab, 16 ref.

Descriptors: *Sediment transport, *Beaches, *Groundwater, *Surf, Erosion, Sedimentation, Percolation, Groundwater movement, Water levels, Water level fluctuations, Virginia.
Identifiers: Virginia Beach (Va).

A 30-day-long time series of observations of variables in the beach-ocean-groundwater system was made at Virginia Beach, Virginia, during August and September 1969. Results of linear multiregression analysis of the data show that the change in ocean still-water level is the single most important variable influencing changes in quantity of foreshore sand over intervals of half-tidal-cycle to tidal-cycle length. An index of groundwater head is the next strongest predictor of sand volume, followed closely by the number of swash events over the time interval in question. (See also W73-14985) (Knapp-USGS)
W73-14988

GROUNDWATER FLOW IN A SANDY TIDAL BEACH. 1. ONE-DIMENSIONAL FINITE-ELEMENT ANALYSIS,
Virginia Inst. of Marine Science, Gloucester Point.
W. Harrison, C. S. Fang, and S. N. Wang.
In: Investigation of the Water Table in a Tidal Beach; Virginia Institute of Marine Science Special Scientific Report No 60, p 63-109, October 1971. 7 fig, 2 tab, 13 ref.

Descriptors: *Water level fluctuations, *Water table, *Beaches, *Tides, *Waves (Water), Data collections, Sands, Instrumentation, Groundwater movement, Surface-groundwater relationships, Beach erosion, Sediment transport, Surf, Virginia.
Identifiers: *Virginia Beach (Va).

Flunctuations in the beach water table at Virginia Beach, Virginia, were studied. Special instrumentation was designed for monitoring the water-table surface. The major environmental variables responsible for the fluctuations were evaluated by multiregression analysis in which the dependent variable was the rise of the water table in a well, and the independent variables were atmospheric pressure, the rise in ocean still-water-level, the distance of the well from the foreshore, and the contribution of the uprush to the water table. One- and two-dimensional finite-element models were constructed to model the groundwater flow. Descriptions of and listings for the FORTRAN computer programs are given. Changes in foreshore sand volume, as a result of fluctuations in the water table, changes in head gradient, and oscillations in the oceanic still-water level were also studied. Predictor equations were developed for changes in quantity of foreshore sand over intervals of one-half and entire tidal cycles. (See also W73-14985) (Knapp-USGS)
W73-14989

AQUIFER DIFFUSIVITY OF THE OHIO RIVER ALLUVIAL AQUIFER BY THE FLOOD-WAVE RESPONSE METHOD,
Geological Survey, Louisville, Ky.
H. F. Grubb, and H. H. Zehner.
Journal available from Sup Doc, GOP, Washington, D.C. 20402 Price $2.75. Journal of Research of the U.S. Geological Survey, Vol 1, No 5, p 597-601, September-October 1973. 6 fig, 1 tab, 7 ref.

Descriptors: *Groundwater movement, *Flood waves, *Surface-groundwater relationships, *Aquifer testing, Alluvium, Alluvial channels, *Ohio River, Base flow, Recession curves.
Identifiers: Aquifer diffusivity.

Aquifer diffusivity was calculated for 10 sites in the alluvial aquifer adjacent to the Ohio River by observing the response of the aquifer to a flood wave in the river. Calculated type curves matched the observed aquifer response reasonably well at eight of the 10 sites. The diffusivities ranged from 0.4 sq ft per sec to 10.3 sq ft per sec and were generally in agreement with diffusivity values calculated from pump-test methods at two of the sites. Determining the shape of the groundwater recession curve may be difficult, but it can be done satisfactorily by collecting water-level data during an extended period of groundwater discharge and transposing the average recession curve to the flood period being analyzed. The flood-wave response method for estimating aquifer diffusivity provides a relatively inexpensive technique for obtaining a significant part of the data needed to predict the aquifer's response to river and pumping stresses. (Knapp-USGS)
W73-14991

A MODIFIED MONTE CARLO TECHNIQUE TO SOLVE GROUNDWATER MOVEMENT AS AFFECTED BY FLOOD STAGES,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
S. F. Shih.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 349-362, 1973. 6 fig, 3 tab, 9 ref.

Descriptors. *Groundwater movement, *Floods, *Monte Carlo method, Surface-groundwater relationships, Statistical methods, Computer programs, Unsaturated flow, Saturated flow
Identifiers: Random walk method

The Monte Carlo method can be applied in obtaining the approximate solution of the problems of groundwater movement as affected by various flood stages. The advantages of applying the Monte Carlo method to problems of water movement in soils are that difficult problems such as various flood stages, irregular-shaped boundaries, and nonhomogeneous flow media, where analytical formulation is not generally available can be solved; and also, systems with solutions at only a few points in the flow media can be solved independently. The simultaneity or modified Monte Carlo procedure was developed to hasten the classical Monte Carlo application. The simultaneity procedures can be applied directly to obtain the solution of groundwater movement as affected by various flood stages without analytically solving the flow equation. The simultaneity procedure has the same accuracy as the classical Monte Carlo method but computing time is reduced by approximately 50% in the fixed random walk procedure and 30% in the arbitrary-shaped random walk procedure. Arbitrary-shaped random walk procedure can reduce by 50% the computing time in both classical and simultaneity procedures. (Knapp-USGS)
W73-15055

2G. Water in Soils

THE INFLUENCE OF SLOPE ORIENTATION UPON THE SOIL MOISTURE REGIME, AND ITS HYDROGEOMORPHOLOGICAL SIGNIFICANCE,
Birkbeck Coll., London (England).
I. Reid.
Journal of Hydrology, Vol 19, No 4, p 309-321, August 1973. 4 fig, 2 tab, 38 ref.

Descriptors: *Slopes, *Geomorphology, *Soil moisture, Water balance, Rainfall disposition, Infiltration, Erosion, Degradation (Slope), *Soil water movement, Solar radiation, Evapotranspiration.
Identifiers: Slope orientation.

Slope insolation provides a basis for the differentiation of microenvironments within which various soil moisture regimes control differences in soil behavior. Limiting factors, however, regulate evapotranspiration losses so that, cumulatively, spatial inequalities are diminutive. Nevertheless, seasonal divergence of soil and soil moisture conditions is sufficient to effect within-catchment differences in water disposition. Groundwater seepage and springs are more characteristic of the north-facing valley sideslope. Similarly with the recurring morphoclimatic problem of asymmetry, the maximum seasonal differences in soil condition and water disposition effect spatial differentiation in the efficiency of landforming processes over restricted parts of the annual cycle. Through a considerable time span, these differences may gain morphological expression, in the absence of overriding and countering processes. (Knapp-USGS)
W73-14831

RAINFALL EXCESS MODEL FROM SOIL WATER FLOW THEORY,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
R. E. Smith, and D. L. Chery, Jr.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY9, Paper 9990, p 1337-1351, September 1973. 13 fig, 9 ref, append.

Descriptors: *Rainfall-runoff relationships, *Infiltration, Mathematical models, Computer programs, Hydraulics, Overland flow, *Soil water movement, Rainfall intensity, Antecedent precipitation, Precipitation excess, Model studies.

The complex (computer-dependent) solution of the partial differential equation for unsaturated soil moisture flow equation was used to develop a simple parametric description of the performance of a variety of soils under various rainfall input rates and patterns, and initial moisture contents. This description is expressed in terms of an infiltration model that is dependent on accumulated soil water. The model is incorporated in a kinematic model of rainfall-runoff response, and its predictions are compared with those of an empirical model of infiltration developed by the USDA Hydrograph Laboratory. The results emphasize the practical utility of the model and its potential advantages over comparable empirical models as well as the inadequate sensitivity of equipment currently used to measure rainfall and runoff from small plots. Descriptors: *Land reclamation, *Saturated soils, *Soil moisture, *Water balance, *Water storage, Water table, Zone of aeration, Groundwater, Root zone, Infiltration, Evaporation, Precipitation (Atmospheric), Drainage, Wetlands, Bogs, Peat, Seasonal, Equations.
Identifiers: *USSR (Poles'ye Lowland), Water exchange.

A major problem in reclamation of excessively wet land is that of regulating soil moisture within optimal limits for normal crop growth and for high and stable yields. This problem can be solved on the basis of water-balance computations performed for individual seasons of the year. Consideration must be given to calculations of groundwater levels, infiltration, and water storage in soil layers in the zone of aeration, including the root zone. Water-balance equations for groundwater in saturated soils during the warm period of the year, winter, and spring are presented. The balance equations proposed can be used as a basis for forecasting water content in reclaimed saturated soils and for planning measures to create the required water regime in years of varying moisture. The ratio of total evaporation to precipitation on drained and undrained bogs of the Poles'ye Lowland is tabulated, and water regime in the root zone of peat cropped to perennial grasses and relation of water storage in the 0-50 cm peat layer to the groundwater level are graphed. (Josefson-USGS)

GENERALIZED HYDROLOGIC MODELING, A KEY TO DROUGHT ANALYSIS,
National Weather Service, Sacramento, Calif. River Forecast Center.
R. J. C. Burnash, and R. L. Ferral.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 503-514, 1973. 1 fig, 9 ref.

Descriptors: *Droughts, *Mathematical models, *Soil moisture, Groundwater, Water storage, Streamflow, Evaporation, Systems analysis.

Drought is an abnormal moisture deficiency in relation to need. This deficiency can be identified in terms of shallow rooted plants, deeper rooted plants, and water supply. A generalized hydrologic model of drought was developed for use on digital computers. This model computes soil moisture in both shallow and deeper parts of the root zones as well as groundwater storage available for streamflow generation. A drought regime does not necessarily involve all components simultaneously; the different deficiencies may have different effects. Through the use of system mechanics, local moisture deficiencies and their abnormalities may be evaluated for each requirement. (Knapp-USGS)

THE EMERSON DISPERSION TEST AND ITS RELATIONSHIP TO HYDRAULIC CONDUCTIVITY,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Soils.
J. Loveday, and J. Pyle.
Technical Paper No 15, p 1-7 1973. 4 fig, 8 ref.

Descriptors: *Soil analysis, *Soil physical properties, *Dispersion, *Hydraulic conductivity, Irrigation efficiency, Infiltration rates, Soil dispersants, Irrigation, Agriculture, Hydrologic models.
Identifiers: *Emerson Dispersion Test.

Soil evaluation for purposes of irrigation can be made by studying the stability of soil structure and its relationship to water infiltration and surface crusting. Details of the Emerson (1967) dispersion test, modified to make it a routine procedure for comparing the dispersability of soil aggregates, are given with a method of scoring to provide a dispersion index (DI) which involves both degree and rate of dispersion. A method for evaluating soils, especially for irrigation, should allow a first sorting of soils to reduce the requirement for hydraulic conductivity (K) measurements. With DI greater than 8, K was invariably less than 0.1 cm/hr, a value below which soils require improvement for successful irrigation agriculture. (Bahre-Ariz.)

SOIL SURFACE LICHENS IN ARID AND SUB-ARID SOUTHEASTERN AUSTRALIA. III: THE RELATIONSHIP BETWEEN DISTRIBUTION AND ENVIRONMENT,
Adelaide Univ. (Australia). Dept. of Botany.
R. W. Rogers.
Australian Journal of Botany, Vol 20, No 3, p 301-316, December 1972. 8 fig, 8 tab, 7 ref.

Descriptors: *Microenvironment, *Soil microorganisms, *Lichens, *Australia, Soil environment, Arid lands, Distribution patterns, Climatic data, Precipitation (Atmospheric), Seasonal, History, Grazing.

The distribution pattern of arid zone soil surface lichens is determined from a consideration of the distribution of species and species groups in relation to soil and climatic factors. It is shown that mean annual rainfall and mean maximum January temperature largely explain the distribution pattern, with seasonal distribution of rainfall indicating that crusts tend not to occur in areas with summer rainfall, or in areas with mean maximum temperatures. Soil variables such as pH, nature of the surface, calcium concentration, and sodium concentration indicate a potential relation to distribution. A map shows the actual and potential

pattern of distribution as well as two postulated areas in which a lichen crust does not now exist because of early settlement patterns of pastoral occupation on land that had a more permanent water supply than the surrounding area, allowing for relatively intense stocking with sheep. (Bahre-Ariz.)

CHEMICAL ECOLOGY OF HYDROGEN SULFIDE PRODUCTION IN FRESHWATER LAKE SEDIMENT,
Michigan Univ., Ann Arbor. Dept. of Industrial Health.
D. A. Dunnette, D. P. Chynoweth, and K. H. Mancy.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 2, p 5-13, 1973. 3 fig, 4 tab, 10 ref.

Descriptors: *Hydrogen sulfide, *Bottom sediments, *Lakes, *Decomposing organic matter, Sulfur bacteria, Water pollution effects, Eutrophication, *Michigan.
Identifiers: *Third Sister Lake (Mich).

Cysteine decomposition contributes significantly to the formation of H2S in anoxic freshwater lake sediment (a range of 5-57% was observed). Total seasonal variation in H2S production in a small unpolluted southeastern Michigan lake was 1.2-3.8 mg per liter per day at one station (15 m deep) and 1.0-2.8 at another (9 m deep) in sediment at 7 deg C. Seasonal variations were quite different at the two stations for sulfate reduction and quite similar for cysteine decomposition. Numbers of proteolytic organisms in sediment correlate well (r±0.86, 0.94) with cysteine decomposition and resulting production of hydrogen sulfide. Numbers of sulfate reducing bacteria bear an inverse relation (-0.69) to proteolytic organisms suggesting a competition for nutrients or response to toxic metabolites including H2S. Sulfate reduction does not correlate significantly with numbers of sulfate reducers, sulfate or carbon in the natural environment. Pollutional input of reducible organic carbon compounds including cysteine and protein result in dramatic increases in hydrogen sulfide production via both sulfate reduction and cysteine decomposition. VEGETATION OF THE LAKE IPEA REGION, NEW GUINEA HIGHLANDS: II. KAYAMANDA SWAMP,
Australian National Univ., Canberra. Research School of Pacific Studies.
D. Walker.
J Ecol. Vol 60, No 2, p 479-504. 1972.
Identifiers: Bryophytes, Dicots, Eutrophication, Ferns, Flora, Highlands, Inorganic matter, Lakes, Monocots, Mud, *New Guinea (Lake Ipea), *Swamps, *Vegetation.

Selected attributes of vegetation (including bryophytes, ferns, monocots, dicots) and environment of Kayamanda Swamp near Lake Ipea (Iviva) at about 2500 m above sea level in the New Guinea Highlands are described. The flora (126 taxa) classifies convincingly with or without the inclusion of 54 'rare' taxa; the classification is not maintained by reduction of the data to the quantitatively predominant plants. Many of the floristic groups have distributions related with obvious environmental variables. An analysis of the quantities of different taxa present differs only slightly from that based on presence or absence alone but provides a classification more readily correlated with environmental variety. The vegetation is best conceived as falling into 8 units each composed of a number of floristic groups in a variety of combinations. The distributions of these groups is most closely related to land:water relationships and to the degree of disturbance of pigs. Two main hydroseral sequences are hypothesized depending on the significant presence or otherwise of inorganic material in the accumulating mud; stratigraphic confirmation of these series is negligible. The future development of the swamp will be determined by the rapidity of incision by the outflowing stream, the building of banks along its course and the erosional and eutrophication effects of pigs.--Copyright 1973, Biological Abstracts, Inc.

REMOTE SENSING OF TURBIDITY PLUMES IN LAKE ONTARIO,
Geological Survey, Arlington, Va.
E. J. Pluhowski.
Journal available from Sup Doc, GPO, Washington, D.C. 20402 Price $2.75. Journal of Research of the U.S. Geological Survey, Vol 1, No 5, p 609-614, September-October 1973. 5 fig, 3 ref.

Descriptors: *Remote sensing, *Aerial photography, *Turbidity, *Lake Ontario, Suspended load, Data collections, Hydrologic data, Path of pollutants, Industrial wastes.

High-altitude photography provides an effective method of monitoring the spatial extent of turbidity plumes in Lake Ontario. Large plumes generated by the Niagara, Genesee, and Oswego

Rivers are identifiable on photographs obtained from about 60,000 feet above the lake on July 6, 1970, October 19, 1970, and May 29, 1971. The Niagara plume, covering as much as 43 sq mi of the lake's surface, is the largest turbidity feature. The configuration of the plumes is a function of river discharge, level of turbidity, and wind speed and direction. (Knapp-USGS)

SPECIFIC CHARACTER OF THE STRUCTURE AND DYNAMICS OF RESERVOIR WATER MASSES (O SPETSIFICHNOSTI STRUKTURY I DINAMIKI VODNYKH MASS VODOKHRANILISHCH),
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
N. V. Butorin.
Vodnyye Resursy, No 2, p 53-63, 1972. 3 tab, 16 ref.

Descriptors: *Reservoirs, Water properties, Water structure, *Water analysis, *Water quality, Water balance, Rivers, Inflow, Regulated flow, Regulation, Seasonal, Meteorology.
Identifiers: Rybinsk Reservoi.

The main objective of water analysis is to distinguish individual varieties of water and to describe their water-quality characteristics. To distinguish and describe water masses in reservoirs, a complex of physical and chemical characteristics are used: temperature, color, transparency, electrical conductance, hardness, bicarbonate concentration, and, in some cases, alkalinity, acidity, pH, and concentration of dissolved oxygen. Two fundamentally different varieties of water are present in reservoirs: river water (inflow) and reservoir water. Because of its shape, size, and character of regulated flow, the Rybinsk Reservoir in the Volga Cascade was used to study formation, distribution, and dynamics of sharply differentiated water masses. Lloydia, Vol 36, No 1, p 72-79, March 1973. 3 tab, 24 ref. OWRR A-025-MINN (7).

Descriptors: *Aquatic plants, Lipids, *Minnesota, Lakes, Chemistry.
Identifiers: Alkaloids, *Flavonoids, Steroids, Nuphar variegatum, Sagittaria latifolia, Potamogeton natans.

Twenty-two aquatic plants were collected from various Minnesota lakes and studied for the presence of alkaloids, flavonoids, steroids, and lipids. Alkaloids are present in Nymphaea tuberosa and Nuphar variegatum. Flavonols and flavonones were often present in the plants studied whereas anthocyanidins and aurones were not. Beta-sitosterol was present in eight, and saponin in five of the plants studied. Cardenolides, as well as 3- and 17-oxo-steroids, were absent from the plants surveyed. Potamogeton natans, Sagittaria latifolia and N. tuberosa contained relatively higher total lipid contents (5.35, 5.24 and 3.91 weight % of dried plant material, respectively) than the other 19 species studied. Arch Hydrobiol. Vol 70, No 3, p 379-391, 1972. Illus.
Identifiers: African swamps, Lakes, Limnological studies, *Malawi (Lake Chilwa), Seasonal, Spatial changes, *Swamps, Nutrients, *Ion, Nitrates.

Seasonal changes and spatial differences in the swamps of Lake Chilwa were investigated. Changes in physical factors, water chemistry and selected soil factors are shown. A comparison between the swamp and the open lake shows that concentrations of most major ions reach high levels in the swamp when compared with the lake. High releases of nitrate were detected following flooding of the marginal soils which are dry for a period each year. The significance of these changes in the swamps is discussed with reference to the lake nutrient budget.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: African lakes, Dry period, Lakes, *Malawi (Lake Chilwa), *Saline lake recovery, *Endorheic lakes.

Lake Chilwa, a shallow, endorheic lake in Central Africa (Malawi), recently refilled after being virtually dry over a year. The refilling, which was completed in 5 mo., was associated with a rapid dilution of initially high levels of dissolved salts and a high suspended sediment load resulting from erosion of the lake bottom. Over a 2 yr period following refilling (Dec. 1968 to Dec. 1970) there was a significant decrease in water turbidity accompanied by the deposition of a fine-grained silt blanket. Particular attention was given to horizontal variations in mud and water during the original filling and in subsequent seasonal cycles. The his-

tory of the lake during its recovery was compared with the situation when the lake was drying out. Some biological characteristics of the recovery regime and the probable course of events until the next dry period are considered.--Copyright 1973, Biological Abstracts, Inc.

HYDROGRAPHICAL DATA FROM 2 SOFT WATER LAKES WITH SPECIAL REFERENCE TO PRECIPTIATION (MELT WATER),
Oslo Univ. (Norway). Dept. of Limnology.
O. Groterud.
Arch Hydrobiol. Vol 70, No 3, p 277-324. 1972. Illus.
Identifiers: Hydrographical data, Lakes, *Norway, *Precipitation, *Soft water lakes, *Melt water, Iron.

The 2 investigated lakes, Sandtjern and Ovre Heimdalsvatn, Norway, are poor in electrolytes, and they developed a clinograde O2 distribution during winter with accumulation of salts, especially Fe, in the deep water. The precipitation in both lake areas showed pH values between 4 and 5. The relation between pH and SO4 indicates H2SO4 in the precipitation. The hydrography of Sandtjern indicates a close connection to the precipitation, especially to the melt water. Ovre Heimdalsvatn seems also to be affected by the precipitation, but is in addition influenced by the drainage area.--Copyright 1973, Biological Abstracts, Inc.

THE RADIATION AND ENERGY BALANCES OF CONIFEROUS AND DECIDUOUS FORESTS,
New Univ. of Ulster, Coleraine (Northern Ireland). School of Biological and Environmental Studies.
S. J. Tajchman.
J Appl Ecol. Vol 9, No 2, p 359-375, 1972. Illus.
Identifiers: *Coniferous forests, *Deciduous forests, *Energy balance, Forests, Humidity, Radiation, Spruce, Temperature, Transpiration, Wind.

A method is described for evaluation of profile-measurements above a vegetation cover in order to calculate its energy balance. The equations given by the aerodynamic and by the Bowen ratio methods for calculating evapotranspiration and sensible heat fluxes from the forest are applicable if the experimental site satisfies the theoretical specifications. The levels of maximum values of temperature and specific humidity lie much higher than the zero plane displacement for wind profile (day time), and the log-law does not fit the experimental data on temperature and humidity profiles above the forest. The energy balance of a spruce forest during the growing season was studied and compared with that of a deciduous forest. The difference in a seasonal course of the radiation and energy balances of both types of forests is mainly caused by albedo changes of a deciduous forest. In 2 definite examples, it was shown how the structure of the forest influences the vertical profiles of radiation density, transpiration and sensible heat fluxes within the canopy. The experimental data on radiation flux density within the forest canopy agree with theoretical results only when the sun elevation is greater than 45 deg.--Copyright 1973, Biological Abstracts, Inc.

SOME EFFECTS OF SOIL WATER TABLES ON THE GROWTH OF SITKA SPRUCE IN NORTHERN IRELAND,
Ministry of Agriculture, Belfast (Northern Ireland). Chemistry and Animal Nutrition Research Div.
S. N. Adams, D. A. Dickson, and I. S. Cornforth.
Forestry (Oxf). Vol 45, No 2, p 129-133. 1972.
Identifiers: Depth, Drainage, Growth, *Ireland, Picea-Sitchensis, Rooting, Sitka, *Soil water, *Spruce, Texture.

Soil water tables and the rooting depth of trees were studied in 2 areas of gleyed soils in Lisnaskea Forest, Fermanagh, Ireland, where growth of Sitka spruce (Picea sitchensis Carr.) is far from uniform. On both areas, poor tree growth is associated with high water tables and shallow rooting. Soils under good trees had a sandy-textured horizon associated with rotten rock fragments. This horizon could improve drainage conditions and must have been present before planting. High soil water tables are a cause rather than a consequence of poor tree growth.--Copyright 1973, Biological Abstracts, Inc.

GROWTH CHARACTERISTICS OF OPUNTIA IMBRICATA (HAW.) DC. IN NEW MEXICO,
New Mexico State Univ., University Park. Dept. of Animal, Range and Wildlife Sciences.
J. G. Fraser, and R. D. Pieper.
Southwest Nat. Vol 17, No 3, p 229-237, 1972. Illus.
Identifiers: *Cholla growth, Moisture, *New Mexico, Opuntia-imbricata, Rainfall, Soils.

Growth of O. imbricata (Haw.) DC. was studied by periodically measuring lengths of new branches during the growing season. During 1967, when rainfall was plentiful, large and medium plants grew at a faster rate than small plants. However, during 1968 when rainfall was below average, the growth rate differed little among plants of different size classes. Cholla began growth earlier in the season than herbaceous vegetation and completed growth while herbaceous plants were still actively growing. Cholla growth was only slightly correlated with soil moisture while herbaceous production was correlated with soil moisture content at three depths. Direct competition for moisture between cholla and herbaceous vegetation may be minimized by differences in growth periods and utilization of different sources of moisture for growth.--Copyright 1973, Biological Abstracts, Inc.

PRODUCTIVITY OF AN ARID ZONE SHRUB (EREMOPHILA GILESII) COMMUNITY IN SOUTH-WESTERN QUEENSLAND,
Charleville Pastoral Lab. (Australia).
W. H. Burrows.
Australian Journal of Botany, Vol 20, No 3, p 317-329, December 1972. 8 tab, 45 ref.

Descriptors: *Productivity, *Biomass, *Shrubs, *Phosphorus, *Litter, Desert plants, Rainfall, Distribution patterns, Organic matter, Degradation (Decomposition), Yield equations, Evaporation, Measurement, Climatic data, Abiotic environment, *Australia.

Data collected over a period of a year on the above-ground biomass of a monospecific Eremophila gilesii shrub community (69,200 bushes/ha including seedlings) showed a mean value of 2106 kg/ha (range 1502/2402 kg/ha) over a year of measurement. Above-ground primary production (biomass increment and litter fall) average 0.23 g/m2/day. Rainfall utilization represented 3700 g water/g above-ground dry matter produced. A comparison with other Australian arid zone shrub vegetation of similar biomass reveals that the proportion of the total nitrogen and phosphorus pool incorporated in the organic matter is high. Rainfall produced the greatest litter; with a variation measured throughout the rest of the year. Average litter breakdown time was estimated to be 20 months; but along with decomposition, accounted for the release of up to 0 deg 33 kg organic phosphorus per hectare each year. About 53% of the phosphorus content in green leaves is extracted before abscission for redistribution within the plant. Well over half the phosphorus required for the above-ground production each year is provided by the intrinsic and extrinsic sources of organic phosphorus. The results are discussed in relation to the possible center or origin of Eremophial and the adaptation of E. gilesii to its harsh abiotic environment. (Bahre-Ariz.)

BRAZILIAN GROUND WATER CRUSTACEA: 1. STUDIES ON THE GENERA PARASTENOCARIS KESSLER AND FORFICATOCARIS JAKOBI FROM SERRA DO MAR OF SAO PAULO (COPEPODA, HARPACTICOIDEA), (IN GERMAN),
Kiel Univ. (West Germany).
W. Noodt.
Crustaceana (Leiden). Vol 23, No 1 , p 76-99, 1972, Illus, (English summary).
Identifiers: *Brazil (Serra do Mar), Copepoda, Crustacea, *Forficatocaris, Forficatocaris-Claudii, Forficatocaris-Evelinae, Forficatocaris-Jakobii, Forficatocaris-Lilianae, Genera, Geography, Harpacticoidea, *Parastenocaris, Parastenocaris-Divae, Parastenocaris-Tageae, Species, Zooplankton.

Six new species of the family Parastenocarididae, from interstitial groundwater along streams on the slope of the Serra do Mar of Sao Paulo, are described. Parastenocaris divae and P. tageae belong to the remanei-group. Forficatocaris claudii, F. lilianae, F. evelinae and F. jakobii form a separate species group which probably is closely related to F. forficata (Noodt) from Santarem. The biogeography of the species of Forficatocaris, which is endemic to the Neotropical Region, and of those of the remanei-group of Parastenocaris, is discussed briefly.--Copyright 1973, Biological Abstracts, Inc.

ETERMINATION OF XYLEM TENSIONS IN HE CROWN OF A GIANT SEQUOIA: EQUOIADENDRON GIGANTEUM,
ochschule fuer Bodenkultur, Vienna (Austria).
otanisches Institut.
. Holzner.
ora (Jena). Vol 116, No 4, p 401-420, 1972, Illus, nglish summary).
entifiers: *Sequoia (Giant), Sequoiadendron-Giiteum, Sun, *Xylem tensions, Trees.

cholander's pressure chamber technique was ed for determining suction tensions (±xylem ater potentials) in the crown of a giant sequoia, giganteum (Lindl.) Buchholz. The influence of peated cutting on readings was found to be conderable, when 20 min had elapsed between tachment of a branch and removal of a piece of em. Equilibrium pressures became smaller in teral shoots removed after some time from cut anches, indicating a withdrawal of the water olumn from the first cutting, probably through ater uptake by leaf cells. Excessive trimming of anches and gradual detachment of small twigs om cut branches are not recommended, therere, unless immediately after the first cutting. aily fluctuations of suction tension at 7 m above e ground show a good agreement between vapor essure deficits calculated from meteorological ata and tensions in shaded twigs. Xylem tensions twigs exposed to full sunlight gradually rise over e shadow curve from morning to noon, reaching maximum difference of approx 7 atm. Minimum nsions are observed shortly before sunrise. Tenon gradients from the lowest branches (7 m bove ground) to the top (24-48 m) show only a ow rise when transpiration is reduced, especially mediately before sunrise. During the day, they e steeper in the shade (e.g., under cloudy sky) an in full sunshine. Measurements of potential smotic pressures indicate that twigs in the top of e crown are unable to heighten their tensions as uch as low twigs because of osmotic difficulties. hese are overcome in winter and early spring, hen potential osmotic pressures are high and perit very steep gradients in full sun.--Copyright 973, Biological Abstracts, Inc.

TUDY OF THE HELMINTH FAUNA OF OMESTIC ANIMALS IN AREA OF DANUBE OWER STATION: III. HELMINTH FAUNA OF VATER FOWLS IN ZITNY OSTROV (CZECHOSLOVAKIA). (IN CZECH),
lovenska Akademie Vied, Kosice (Cechoslovakia). Helmintologicky Ustav.
. Busa.
tud Helminthol. 2 p 49-54. 1968, (English summay).
dentifiers: Amidostomum-Anseris, Anomotaenia-Ciliata, Bilharziella-Polonica, Capillaria-Anseris, Czechoslovakie (Zitneg Ostrov), *Danube, Power station, Domestic animals, Drepanidotaenia-Lanceolata, Ducks, Echinostoma-Revolutum, Ecology, Fauna, Fowls, Goose, *Helminth, Philophthalmus-Hovorkai, Polymorphus-Magnus, Porrocaecom-Crassum, Power stations, Thominx-Contorta.

The most frequent trematode species in the region of the Zitny Ostrov are Bilharziella polonica and Echinostoma revolutum occuring in the duck. In geese, the relatively frequent occurrence of a new trematode species Philophthalmus hovorkai was reported. The most frequently occurring cestode of ducks was Anomotaenia ciliata, whereas Drepanidotaenia lanceolata was most frequent in geese. Thominx contorta and Porrocaecum crassum are the most common nematodes of ducks; Amidostomum anseris and Capillaria anseris were most frequent in geese. Polymorphus magnus was found in ducks. Both hosts present relatively severe helminth infestations (ducks 92.1%, geese 97.9%). In ducks nematodes and trematodes are the most frequently occurring helminth species (82.6 and 65.8%, respectively). In geese nematode infestations occur most frequently (95.7%), then follow cestode infestations (17.0%). The helminth status of both ecological categories, biohelminths (21 species) and geohelminths (4 species), indicates conditions which are particularly favorable for biohelminths.--Copyright 1973, Biological Abstracts, Inc.

REGULATION OF STOMATAL APERATURE IN ISOLATED EPIDERMAL PEELINGS OF CITRULLUS COLOCYNTHIS (LINN.) SCHRAD, WITH PHENYLMERCURIC ACETATE AND POTASSIUM CHLORIDE,
Jodhpur Univ. (India). Dept. of Botany.
M. C. Bhandari, and David N. Sen.
Biochem Physiol Pflanz (BPP). Vol 163, No 3, p 320-323, 1972, Illus.

Descriptors: Acetates, Chlorides, Citrullus-Colocynthis, Epidermal, Isolated, Light, Mercuric compounds, Peelings, Potassium, Regulation, *Stomaal aperature, Toxicity.

Both KC1 and phenylmercuric acetate (PMA) remained ineffective in bringing about opening or closure of stomatal aperatures, respectively, in total darkness. PMA failed to close the stomatal aperture in the presence of K+ ions in guard cells. The induction of smaller stomatal aperture by KC1 after PMA in light appeared to be due to some injurious or toxic effect of the latter on guard cells in the isolated epidermal strips of C. colocynthis.--Copyright 1973, Biological Abstracts, Inc.

TEXTURAL TREND ANALYSIS OF COASTAL BARRIER SEDIMENTS ALONG THE MIDDLE ATLANTIC BIGHT, NORTH CAROLINA,
Old Dominion Univ., Norfolk, Va. Dept. of Geophysical Sciences.
G. L. Shideler.
Sedimentary Geology, Vol 9, No 3, p 195-220, June 1973. 7 fig, 2 tab, 20 ref. Old Dominion Univ. Grant GR-71.

Descriptors: *Sedimentation, *Barrier islands, *Beaches, *North Carolina, *Sedimentary structures, Particle size, Winds, Dunes, Currents (Water), Littoral drift, Statistics, Sediment transport, Provenance, Stratigraphy, Analysis.
Identifiers: *Trend analysis.

Comparative polynomial trend analyses of textural parameters were conducted on adjacent foreshore, berm, and dune sediment populations along a coastal barrier chain of the Middle Atlantic Bight. Systematic textural patterns exhibited by the barrier sediments consist of both regional trends and local cyclicity. The regional trends reflect progressive variability of both the hydraulic and aeolian regimes. Variability of the hydraulic regime consists of a progressive southward increase in average wave energy, with a concomitant decrease in energy consistency; this is attributed to the coastal wave refraction pattern, and to a progressive southward decrease in shelf width. The aeolian regime is characterized by a constant average energy level along the barrier chain, but exhibits a progressive northward decrease in wind energy consistency, and a corresponding increase in winnowing efficiency. Local cyclicity along the barrier reflects textural variations in the barrier source materials excavated from a heterogeneous Pleistocene substrate. The cyclic patterns suggest the presence of a buried ancestral Albemarle fluvial channel near the present mouth of albemarle Sound. In developing systematic textural variations along the barrier, size characteristics of the source material are the most influential factor, while the influences of both the hydraulic and aeolian regimes are subordinate. The berm and dune field environments are most amenable to the development of systematic variation, while the foreshore is most susceptible to random component variation. (Knapp-USGS)

MARINE GEOLOGY OF THE ALEUTIAN ABYSSAL PLAIN,
Naval Undersea Research and Development Center, San Diego, Calif.
E. L. Hamilton.
Marine Geology, Vol 14, No 5, p 295-325, June 1973. 16 fig, 2 tab, 50 ref, append.

Descriptors: *Bottom sediments, *Pacific Ocean, *Sedimentation, *Marine geology, Oceanography, Provenance, Turbidity currents, Stratigraphy.
Identifiers: *Aleutian Abyssal Plain.

The Eocene-Oligocene, turbidite Aleutian Abyssal Plain was deposited from channelized turbidity currents from the north or northeast. The plain is bounded on the south by the northern ridges of the Surveyor Fracture Zone, and is isolated from the Tufts Abyssal Plain. Turbidities were deposited from many buried channels and smaller surficial channels, but mainly from four great channels: Seamap, Sagittarius, Aquarius, and Taurus. The channels are depositional features; accumulation of sediments causes the channels to lie, topographically, along low ridges, with channels above distal portions of their levees. Western levees are higher and broader than eastern levees. Levee heights decrease from 30-100 m in the north to 15-25 m in the south. Rates of deposition and thicknesses of pelagic sediments in the northwest are 3 to 4 times greater than in the southeast. The sediment source was probably Alaska. The evidence is consistent with concepts of discontinuous sea-floor spreading with episodic subduction, or discontinuous, relative plate motion in this area. (Knapp-USGS)

OBSERVATIONS OF SHALLOW LAYERING UTILIZING THE PINGERPROBE ECHO-SOUNDING SYSTEM,
Texas Univ., Galveston. Earth and Planetary Sciences Div.
M. Ewing, R. W. Embley, and T. H. Shipley.

Marine Geology, Vol 14, No 5, p M55-M63, June 1973. 5 fig, 13 ref. USNR N00014-67-A-0108-0004 NSF-29460 and NSF GX-30675.

Descriptors: *Sounding, *Bottom sediments, Acoustics, Sonar, *Instrumentation, Hydrography, Surveys, Stratigraphy, *Sounding, Measurement.
Identifiers: *Pingerprobe.

A Pingerprobe is a system of echo sounding in which the sound source is placed near bottom to improve resolution by restricting the area investigated. A commercially available 12-kHz pinger with a synchronized shipboard receiver is useful not only in the monitoring of the positioning of a bottom or near-bottom instrument package (such as a corner) but also in making observations on the acoustic nature of the sea floor. In rough terrain the Pingerprobe can measure stratified sediments in some places where the precision depth recorder cannot. Observations on proximal abyssal plains indicate that the prolonged echo character common to these areas may result from small-scale roughness or inhomogeneity. When a suspended instrument is sent to the bottom in rough terrain, or in areas of intermittent subbottom reflections, use of a Pingerprobe improves information about the conditions at the point of contact and permits selection of the desired topographic setting. THE BOTTOM SEDIMENTS OF THE AMAZON SHELF AND TROPICAL ATLANTIC OCEAN,
Northwestern Univ., Evanston, Ill. Dept. of Geological Sciences.
R. J. Gibbs.
Marine Geology, Vol 14, No 5, p M39-M45, June 1973. 6 fig, 9 ref. ONR Contract N00014-67-A-0356-0011.

Descriptors: *Sediment transport, *Continental shelf, Sedimentation, *South America, Sedimentology, Rivers, Bed load, Suspended load, Mud, Silts, *Bottom sediments.
Identifiers: *Amazon River.

Results of bottom sampling of the parts of the Atlantic Ocean affected by the Amazon River show a concentration of material smaller than 2 micrometers along the shore northwest of the mouth of the Amazon River for 2000 km. A zone having a high percentage of material coarser than 20 micrometers extends outward from the Amazon River and along the outer continental shelf northwestward for 2000 km. Areas having high carbonate percentages are encountered only on the outer shelf and in deep water. The high carbonate percentages in the bottom sediments of the study area obviously reflect biological activity and represent the ecological conditions favorable for growth of carbonate-secreting creatures. The distribution of the terrigenous sediments is contrary to classical theories inasmuch as a mud zone along the shore grades seaward to a silt-and-sand zone. Apparently, silts and sands are not only moved across the wide continental shelf, but some are then transported northwestward along the shelf. (Knapp-USGS)

SIMILARITIES BETWEEN MN, NI AND CO CONTENTS OF DEEP-SEA CLAYS AND MANGANESE NODULES FROM THE SOUTH-WEST REGION OF THE NORTH ATLANTIC,
Liverpool Univ. (England). Dept. of Oceanography.
R. Chester, L. R. Johnson, R. G. Messiha-Hanna, and R. C. Padgham.
Marine Geology, Vol 14, No 4, p M15-M20, May 1973. 1 fig, 2 tab, 13 ref.

Descriptors: *Manganese, *Nickel, *Cobalt, *Bottom sediments, *Atlantic Ocean, Clays, Mineralogy, Water chemistry, Chemical precipitation, Sedimentation.
Identifiers: *Manganese nodules.

In the Atlantic Ocean Mn, Ni and Co tend to be concentrated in those deep-sea sediments deposited in a central zone which extends down the length of the ocean. These trace elements are also concentrated in clays in the southwest region of the North Atlantic. This region is rich in manganese nodules, and the nonlithogenous fractions of some of the clays approximate to those of the nodules in composition. It is suggested that these clays have acquired their relatively high concentration of nonlithogenous trace elements from seawater by processes associated with the formation of manganese nodules. COMPARISON OF RADIOACTIVE GLASSES OF SCANDIUM AND IRIDIUM AS TRACERS IN SEDIMENT-TRANSPORT STUDIES,
Bhabha Atomic Research Center, Bombay (India). Isotope Div.
K. Krishnamurthy, and S. M. Rao.
Journal of Hydrology, Vol 19, No 3, p 189-204, July 1973. 6 fig, 7 tab, 8 ref.

Descriptors: *Tracers, *Sediment transport, *Radioactivity techniques, Bed load, Tracking techniques, Radioisotopes, Sedimentology, Sedimentation.
Identifiers: *Iridium radioisotopes, *Scandium radioisotopes.

A systematic comparison was made of all important criteria for the selection of either scandium-46 or iridium-192 as a radioisotopic glass tracer for bed-load transport studies in rivers and estuaries. Sc-46 provides about 40% more count rate than Ir-192 for equal activities on the surface of the bed. This discussion leads to the conclusion that except for ease of transportation to the worksite, Sc-46 appears preferable to Ir-192. The use of Sc-46 provides higher detection sensitivity with less effect on the response due to the variations in the bed-detector distance. (Knapp-USGS)

SEDIMENTATION IN MANGLA RESERVOIR,
Harza Engineering Co., Chicago, Ill. Industrial Basin Div.
R. W. Szechowycz, and M. M. Qureshi.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY9, Paper 10033, p 1551-1572, September 1973. 7 fig, 10 tab, 13 ref.

Descriptors: *Sedimentation, *Reservoir silting, *Sedimentation rates, Bed load, Suspended load, Deltas, Reservoir storage, Sediment transport, Sediment yield.
Identifiers: *Pakistan (Mangla Dam).

Mangla Dam is located in Jhelum River in West Pakistan. Studies of reservoir sedimentation during the investigation and design period indicated that the proposed capacity of the Mangla Reservoir will be substantially larger than the volume of sediment that will be brought into the reservoir during its economic life. Due to the peculiar topographic configuration of the reservoir area, depletion of storage may not take place at a uniform rate and a substantial portion of the useful storage might be isolated by the accumulation of sediments. A method was developed for predicting the rate of storage depletion and estimating the life of the project. In this context the total annual sediment inflow, the estimate of unit weight of sediment deposits, formation of 'deltas,' and the procedures used in distribution of sediments in the Mangla Reservoir were examined. (Knapp-USGS)

FEATURES OF CROSS-STRATIFIED UNITS DUE TO RANDOM AND OTHER CHANGES IN BED FORMS,
Reading Univ. (England). Sedimentology Research Lab.
J. R. L. Allen.
Sedimentology, Vol 20, No 2, p 189-202, May 1973. 4 fig, 1 tab, 35 ref.

Descriptors: *Beds (Stratigraphic), *Sedimentary structures, *Sedimentation, *Alluvial channels, Ripple marks, Erosion, Sedimentology, Model studies, Hydraulic models, Flumes.
Identifiers: Cross-stratification.

Because cross-stratified units depend upon the movement of bed forms, any change in the shape, size and direction of travel of the forms is reflected in the geometry of the units, notably in their relative length, breadth and thickness, mode of termination upstream and downstream, and internal discontinuities. Changes in bed forms occur at two levels of detail indcpendently. Those at the coarser level depend on the essential nonuniformity, unsteadiness and multidirectionality of natural flows. At the finer level, change is related to the random behavior of individual bed forms as they interact with the adjacent flow, and change proceeds even when the flow is at equilibrium. The streamwise length of bed forms and their upstream and downstream erosional termination, is governed by the lifespan of individual ripples and by the extent of net deposition on the bed. Internal discontinuities depend on the relative motion of ripples, no change of flow discharge and stage being involved. The degree of relative motion in the ripple assemblages was substantial in the flume tests. (Knapp-USGS)

PEBBLE SEGREGATION AND BED LENTICULARITY IN WAVE-WORKED VERSUS ALLUVIAL GRAVEL,
Geological Survey, Menlo Park, Calif.
H. E. Clifton.
Sedimentology, Vol 20, No 2, p 173-187, May 1973. 9 fig, 2 tab, 39 ref.

Descriptors: *Gravels, *Sedimentary structures, *Sediment sorting, *Ripple marks, Sedimentation, Sedimentology, Alluvium, Beaches, Waves (Water), Currents (Water), Stratigraphy, Beds (Stratigraphic).

Two aspects of bedding may permit visual discrimination between wave-worked and alluvial gravel. Pebbles in gravel worked by waves tend to be better segregated into discrete beds than those in alluvial deposits, and bedding in wave-worked gravel tends to be more laterally regular or less lenticular than that in stream gravel. Pebble segregation and lenticularity were quantitatively analyzed in 25 different marine and fluvial deposits of Quaternary or Tertiary age in southwestern Oregon in order to evaluate their use as environmental indicators. These two factors combined provide a visual criterion for discriminating between many gravels of wave-worked and alluvial origin. (Knapp-USGS)

AN APPRAISAL OF THE COMPUTATION OF STATISTICAL PARAMETERS IN GRAIN SIZE ANALYSIS,
Unit of Coastal Sedimentation, Taunton (England).
B. L. Seward-Thompson, and J. R. Hails.
Sedimentology, Vol 20, No 1, p 161-169, February 1973. 4 fig, 2 tab, 6 ref.

Descriptors: *Particle size, *Statistical methods, *Computer programs, Sampling, Sediments, Sedimentology.

A computer program was written to compute statistical parameters in grain-size analysis. This program uses all available data obtained from standard sedimentological analyses, regardless of phi interval, and computes statistical parameters by direct integration of a linear approximation to the cumulative curve. This has the advantage that the distribution curve is known and hence the limitations of the parameters obtained can be assessed. Furthermore, this approximation introduces no greater degree of inaccuracy than is already present in standard sampling and analytical procedures. (Knapp-USGS)
W73-15264

PRECIPITATION AND LITHIFICATION OF MAGNESIAN CALCITE IN THE DEEP-SEA SEDIMENTS OF THE EASTERN MEDITERRANEAN SEA,
Woods Hole Oceanographic Institution, Mass.
J. D. Milliman, and J. Muller.
Sedimentology, Vol 20, No 1, p 29-45, February 1973. 8 fig, 2 tab, 38 ref.

Descriptors: *Calcite, *Chemical precipitation, Sedimentation, Magnesium, Dolomite, Limestones, Calcium carbonate.
Identifiers: *Mediterranean Sea.

Magnesian calcite is an important sedimentary component in the deep-sea sediments of the eastern Mediterranean Sea, about 20%-50% of the carbonates in most areas. The lack of any obvious biogenic source, plus similarities with magnesian-rich lutites from the Red Sea and deep-sea cements from other areas suggest that this magnesian calcite was precipitated inorganically. Although the exact mode of precipitation is not understood at present, it probably occurred at the water-sediment interface under elevated salinity and temperature conditions, such as those present in the modern eastern Mediterranean. Precipitation did not occur during periods of lower temperatures and/or salinities such as during the stagnant conditions caused by the influx of freshwaters from melting Pleistocene glaciers. The eastern Mediterranean magnesium-rich sediments appear to represent an intermediate stage between normal deep-sea sediments and those from the warm hypersaline Red Sea. Normal deep-sea carbonates are composed almost entirely of biogenic calcite, whereas the Red Sea magnesian calcite alternates with layers of aragonite that were precipitated under elevated salinity and temperature conditions brought about by lowered stands of sea level. (Knapp-USGS)
W73-15265

SEDIMENTARY ENVIRONMENTS OF THE EAST-CENTRAL BERING SEA CONTINENTAL SHELF,
Washington Univ., Seattle. Dept. of Oceanography.
H. J. Knebel, and J. S. Creager.
Marine Geology, Vol 15, No 1, p 25-47, August 1973. 7 fig, 1 tab, 56 ref.

Descriptors: *Sedimentation, *Sediment transport, *Alaska, Statistical methods, Statistics, Sea ice, Sediment sorting, Bottom sediments, Currents (Water), Tides, Particle size.
Identifiers: Factor analysis.

A factor analysis of 180 bottom sediment samples from the east-central Bering Sea continental shelf identifies five factors that account for 95% of the variation in the 17 whole phi size classes that were used as variables. Factor I represents coarse sediments that have been bypassed in areas of active water circulation. Factors II and III represent fine and very fine sands that have been hydraulically sorted, reworked, and mixed. Factor IV represents coarse to medium silt that has been segregated from areas of relatively high energy. Factor V represents both the production of sediments finer than medium silt and deposition within the lowest-energy environment in this area. Modern and palimpsest sediments are areally prevalent over this section of the shelf. Relict sediments occur in only a few small areas. The dispersal of sediments is affected by surface and tidal currents as well as wave action. Ice rafting is not an important geological agent. Sediments on subarctic continental shelves are not necessarily characterized by an abundance of rocky sediments or gravel. (Knapp-USGS)

DEEP-SEA ZEOLITES: VARIATIONS IN SPACE AND TIME IN THE SEDIMENTS OF THE INDIAN OCEAN,
Lamont-Doherty Geological Observatory, Palisades, N.Y.
K. Venkatarathnam, and P. E. Biscaye.
Marine Geology, Vol 15, No 1, p M11-M17, August 1973. 1 fig, 9 ref.

Descriptors: *Zeolites, *Bottom sediments, *Indian Ocean, Silicates, Mineralogy, Weathering, Diagenesis, Volcanoes, Stratigraphy, Provenance, Clay minerals.

In the Indian Ocean, the zeolite phillipsite is often found in Miocene and younger sediments and is confined to the central areas of the sea floor. This zeolite forms from the alteration of basic volcanic material and does not require much time for its formation. Another zeolite, clinoptilolite, however, is most often restricted to Cretaceous to Eocene sediments in areas closer to the continental land masses. This distribution in space and time is thought to be due to the availability of silicic volcanics during the early formation of the Indian Ocean in the Cretaceous to Eocene time. The mobilization of silica from opal-rich sediments during these times may also have been an important factor in the formation of clinoptilolite. (Knapp-USGS)

California Univ., Berkeley. Lawrence Berkeley Lab.
B. D. Zak, R. D. McLaughlin, D. A. Church, and T. Hadeishi.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 10, p 52-57, 1973. 1 fig, 1 tab.

Descriptors: *Spectrophotometry, *Trace elements, *Chemical analysis, Photometry, Analytical techniques.
Identifiers: *Isotope-Zeeman atomic absorption photometry.

In order that an adequate program of monitoring of trace elements be feasible, instrumentation must be sensitive, accurate, portable, and relatively inexpensive. The isotope-Zeeman atomic absorption (IZAA) technique provides such instrumentation. In the IZAA technique, a solid, liquid, or gaseous sample is thermally decomposed in a furnace maintained at an appropriate temperature. The decomposition products are then swept into a heated atomic absorption tube by a stream of carrier gas. Here they are probed with a light beam which has two constituents; one constituent has a wavelength centered on the absorption profile of the trace element being measured, while the other is slightly displaced. By taking the difference between the absorption of the two constituents, the absorption due to the trace element alone may be measured. This background cancellation results in strong discrimination against interferences. (Knapp-USGS)

EQUILIBRIUM CONCEPTS IN NATURAL WATER SYSTEMS.
American Chemical Society, Washington, D.C.

Advances in Chemistry Series 67, 1967. 344 p.

Descriptors: *Water chemistry, Water balance, Equilibrium, Aqueous solutions, *Thermodynamic behavior, Equations, *Mathematic studies, Metals, *Water analysis, Sediments, Clays, Oxides, Silica carbonates, Springs, Lakes, Great Lakes, Oceans, Oxidation-Reduction potential, *Geochemistry, Biology, Model studies.
Identifiers: Hydroxides, Carbonate hydroxides, *Equilibrium models, Gibbs phase Rule, *Water solute interactions.

Natural waters are complex systems whose chemistry cannot be described without considering many variables. To overcome this complexity, simplified, manageable models are used to help researchers understand and predict real systems. As of now, the theory of thermodynamic equilibrium appears to be the most expedient concept for the identification of many variables relevant to the identification of the mineral relationships and the establishment of chemical boundaries of aquatic environments. As the state of equilibrium in the open, dynamic system represented by natural waters is an abstraction, a useful model need not be realistic as long as it provides a valuable research tool to help determine the factors that control the chemistry of natural systems. A concept of equilibrium associated with one or more of the many variables that affect total system equilibrium is discussed in each of the 16 chapters. (Smith-NWWA)

CALCULATION OF WATER QUALITY FROM ELECTRICAL LOGS THEORY AND PRACTICE,
Geological Survey, Baton Rouge, La.
A. N. Turcan, Jr.
Louisiana Department of Conservation and Geological Survey, Louisiana Department of Public Works, Baton Rouge. Water Resources Pamphlet No 19, 1966. 23 p, 7 fig, 2 tab, 21 ref.

Descriptors: *Resistivity, *Analytical methods, Water chemistry, Aquifer characteristics, *Conductivity, *Water quality, Electrical well logging, Wells.
Identifiers: *Specific conductance, Interstitual water, *Dissolved solids content.

Data from electrical logs are used by the hydrologist for geologic correlation purposes and for quantitative and qualitative determination of some of the chemical constituents of water in a formation. An empirical method is presented of quantitatively determining the resistivity of the water in unconsolidated formations in the Gulf Coast area from resistivity readings on electrical logs. An estimate of the concentration of some ions in water in an aquifer can be made from electrical logging data if an empirical ratio between the resistivity reading of the electrical log and the resistivity of the formational water has been established. The theory and field applicability of this analytical method are presented. (Campbell-NWWA)

SUSPENDED SEDIMENT TRANSPORT FROM THE GIRONDE ESTUARY (FRANCE) ONTO THE ADJACENT CONTINENTAL SHELF,
Institut de Geologie du Bassin d'Aquitaine, Talence (France).
G. P. Allen, and P. Castaing.
Marine Geology, Vol 14, No 5, p M47-M53, June 1973. 3 fig, 1 tab, 13 ref.

Descriptors: *Sediment transport, *Estuaries, *Continental shelf, Currents (Water), Streamflow, Sedimentation, Turbidity, Suspended load, Silts, Clays, Measurement.
Identifiers: *France (Gironde Estuary).

Current velocity and suspended concentration measurements in the downstream extremity of the Gironde Estuary indicate that during periods of high river discharge, a significant amount of suspended sediment is transported out of the estuary onto the adjacent continental shelf. The vertical profile of the nontidal suspended sediment flux is similar to that of the current velocity, with a net upstream flux near the bottom and an overlying seaward-directed transport. The overall, depth-integrated result is a net seaward transport of suspended sediment out of the estuary. This net seaward transport varies directly with tidal amplitude. Aerial photography and water sampling indicate that during high river inflow, the downstream extremity of the turbidity maximum extends onto the continental shelf at ebb tide. The tidal and coastal current patterns of the inlet and inner shelf induce a northward transport of the turbid estuarine water, and at each tidal cycle, a certain amount of suspended sediment leaves the estuary; part of this sediment is deposited in a silt and clay zone on the continental shelf. (Knapp-USGS)

A CHENIER SEQUENCE AT BROAD SOUND, QUEENSLAND, AND EVIDENCE AGAINST A HOLOCENE HIGH SEA LEVEL,
Bureau of Mineral Resources, Geology and Geophsics, Canberra (Australia).
P. J. Cook, and H. A. Polach.
Marine Geology, Vol 14, No 4, p 253-268, May 1973. 10 fig, 1 tab, 33 ref.

Descriptors: *Beaches, *Deltas, *Sedimentation, *Sea level, Australia, Pleistocene epoch, Erosion, Aggradation, Stratigraphy, Geomorphology, Coasts, Recent epoch.
Identifiers: *Cheniers, *Australia (Broad Sound).

A prograding chenier plain on the west side of Broad Sound, Australia, is up to 5-km wide and individual beach ridges (cheniers) are up to 5-km long. The cheniers formed during periods of low sediment supply, leading to the erosion of mangrove deposits and the development of a beach ridge. Radiocarbon dating revealed that cheniers formed at about 5000, 4500, 3550, 2500, 1600 and 700 years B.P. There is no significant change in the elevation of the cheniers during this 500 year interval. Sea level stabilized at about the present level approximately 5000 years B.P. Since that time mean sea level has varied by no more than 1 m. (Knapp-USGS)
W73-14815

SUSPENDED MATTER IN SURFACE WATERS OF THE EASTERN GULF OF GUINEA,
Woods Hole Oceanographic Institution, Mass.
B. D. Bornhold, J. R. Mascle, and K. Harada.
Marine Geology, Vol 14, No 4, p M21-31, May 1973. 6 fig, 2 plate, 11 ref.

Descriptors: *Suspended load, *Atlantic Ocean, *Ocean currents, Provenance, Sediment transport, Sedimentation, Organic matter, Deltas, *Africa.
Identifiers: *Gulf of Guinea.

Suspended matter in the surface waters of the eastern Gulf of Guinea was studied in relation to the prevailing oceanic currents and the sediment composition and source. A confused current system arises from the confluence of the Guinea Current and the South Equatorial Current in this area. Sediment-laden water is transported to the south of Fernando Poo into the Gulf in a southwesterly direction. The southeasterly flowing Guinea Current along the western edge of the Niger delta and the enormous sediment loads of the distributaries in this area contribute to a major lobe of suspended matter off the southwestern nose of the delta. Sediment concentration is inversely related to salinity in the northeastern Gulf. Sediment is also swept northwestward from the continental shelf of Gabon and the Congo Republic into the Gulf. Diatoms are the most abundant constituents with lesser amounts of organic aggregates and two varieties of fecal pellets. (Knapp-USGS)
W73-14817

HISTORY AND SAND BUDGETS OF THE BARRIER ISLAND SYSTEM IN THE PANAMA CITY, FLORIDA, REGION,
Florida State Univ., Tallahassee. Dept. of Geology.
F. Stapor.
Marine Geology, Vol 14, No 4, p 277-286, May 1973. 5 fig, 9 ref.

Descriptors: *Beaches, *Beach erosion, *Sedimentation, *Barrier islands, *Florida, Sediment

transport, Sedimentation rates, Sand spits, Geomorphology, Coasts, Sand bars.
Identifiers: Panama City (Fla), *St. Andrew Sound (Fla).

Shell Island and Crooked Island peninsulas form the Holocene barrier system in the Panama City, Florida, region. Both of these peninsulas have experienced a history of alternating integration and fragmentation superimposed on a net shoreward migration since 1779. Catastrophic events such as hurricanes are responsible for the pass cutting which has fragmented these barriers. Both barrier peninsulas have very nearly segmented St. Andrew Sound into an eastern and western portion. This segmentation has been achieved through natural causes in the eastern or Crooked Island region, but an alternation in the tidal return pattern, effected by the cutting of a canal across Shell Island, is probably responsible for the ongoing segmentation of the western portion. Rates of erosion and deposition, determined by comparing bathymetries charted in 1877, 1930, and 1946, show that these two peninsulas receive material by eastward transport. The longshore drift of both peninsulas is bidirectional, northwesterly and southeasterly. These two drift components are very nearly equal in magnitude immediately west of Shell Island; net easterly drift occurs on Shell Island peninsula. Crooked Island experiences net westerly and easterly drift; the easterly drift terminates in the Bell Shoal area and does not reach the adjacent St. Joe Spit. (Knapp-USGS)

SHALLOW WATER HYDROIDS OF THE DELAWARE BAY REGION,
Delaware Univ., Lewes. Coll. of Marine Studies.
L. Watling, and D. Maurer.
J Nat Hist. Vol 6, No 6, p 643-649. 1972, Illus.
Identifiers: Bay, Crabs, *Delaware Bay, Hermit, *Hydroids, Oysters, Salinity, Snails,.

Eighteen species of hydroids were identified in Delaware waters. The diversity of this fauna is low with respect to Calder's (1971) studies in Chesapeake Bay (43 spp.). All the species in this study but Eulaomedea angulata occur in Chesapeake Bay. Obelia bicuspidata, O. longicyatha, Garveia franciscana, Tubularia crocea, Hartlaubella gelatinosa, Sertularia argentea and Hydractinia echinata were among the principal local species. Hartlaubella gelatinosa and S. argentea were commonly collected from oyster shells and O. bicuspidata was frequently taken from G. franciscana. Hydractinia echinata was never collected from oyster shells, but was characteristically found on the shells of the moon snail Polinices duplicatus (Say) and mud snail Nassarius obsoletus (Say) inhabited by hermit crabs. Sertularia argentea and in particular Tubularia crocea appear to be important local winter species. A larger number of species occur in the oyster producing tributaries and natural and planted oyster beds of Delaware Bay than in Rehoboth and Indian River Bays. Although the planted beds may be an exception, this may be attributable to less intensive collecting from such areas. Oyster beds contain the largest areas of hard substrate in Delaware waters. The smaller bays consist of soft mud-sand bottoms with intermittent growths of algae and scattered deposits of shell fragments. Salinity is normally higher in Rehoboth (22-28%) and Indian River (20-33%) Bays than in the Leipsic River (12-20%) and over the natural oyster beds (18-22%). In polyhaline salinities the distribution of local hydroids is associated more with a hard substrate than with salinity.--Copyright 1973, Biological Abstracts, Inc.

MINIMUM LENGTH OF SALT INTRUSION IN ESTUARIES,
Technische Hogeschool, Delft (Netherlands). Dept. of Civil Engineering.
B. P. Rigter.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY9, Paper 10010, p 1475-1496, September 1973. 14 fig, 8 tab, 4 ref, append.

Descriptors: *Saline water intrusion, *Estuaries, *Density currents, Stratified flow, Saline water-freshwater interfaces, Tidal waters, Tides, Salinity, Model studies, Hydraulic models, Flumes.

Salt intrusion from a sea basin into estuaries was studied in a rectangular flume. Boundary conditions in the experiments include seawater density, tidal amplitude, and hydraulic resistance. Minimum and maximum lengths of salt intrusion during a tidal cycle are given as functions of the varied quantities. Dimensional analysis was applied to find correlations between the minimum length of salt intrusion and tidal quantities. Results give the relation between a nondimensional parameter containing the minimum length of salt intrusion, the depth and resistance coefficient, and three nondimensional parameters characterizing the tidal movement and containing the density difference between seawater and freshwater. REMOTE MEASUREMENT OF SALINITY IN AN ESTUARINE ENVIRONMENT,
National Aeronautics and Space Administration, Bay Saint Louis, Miss. Earth Resources Lab.
G. C. Thomann.
Remote Sensing of Environment, Vol 2, No 4, p 249-259, 1973. 8 fig, 4 tab, 21 ref.

Descriptors: *Remote sensing, *Salinity, Estuaries, Sea water, Data collections, Hydrologic data, Microwaves, *Mississippi, *Louisiana, Instrumentation, Calibrations.

The microwave emission of seawater is dependent upon salinity in the low microwave spectrum. It is possible to measure remotely the surface salinity using the 21 cm wavelength with an accuracy of one part per thousand in a salinity range of 5 to 35 parts per thousand. The dielectric constant of seawater can be represented by that of NaCl. The effects of the atmosphere, cosmic noise, sea surface roughness, and constant radiometer errors can be

corrected using surface calibration measurements. Experiments were performed in Mississippi and Louisiana coastal waters. (Knapp-USGS)

SUSPENDED SEDIMENT OBSERVATIONS FROM ERTS-1,
Delaware Univ., Newark. Coll. of Marine Studies.
V. Klemas, J. F. Borchardt, and W. M. Treasure.
Remote Sensing of Environment, Vol 2, No 4, p 205-221, 1973. 11 fig, 14 ref. ONR-GP N00014-69-A0407 NASA-ERTS-1 NAS5-21837.

Descriptors: *Remote sensing, *Satellites (Artificial), *Turbidity, *Suspended load, Oceanography, Water circulation, Estuaries, Delaware River, Tides, Data collections, Hydrologic data.
Identifiers: *ERTS, *Delaware Bay.

Satellite imagery from four ERTS-1 passes over Delaware Bay during different portions of the tidal cycle shows suspended sediment, which is a natural tracer for circulation patterns. The MSS red band (band 5) gives the best contrast. Color density slicing improves the differentiation of turbidity levels. However, color additive enhancements are of limited value since most of the information is in a single color band. The ability of ERTS-1 to present a synoptic view of the surface circulation over the entire bay is shown to be a valuable and unique contribution of ERTS-1 to coastal oceanography. (Knapp-USGS)
W73-15002

DISTRIBUTION, TRANSPORT, AND COMPOSITION OF SUSPENDED MATTER IN THE ST. LAWRENCE ESTUARY,
McGill Univ., Montreal (Quebec). Marine Sciences Centre.
B. F. d'Anglejan, and E. C. Smith.
Canadian Journal of Earth Sciences, Vol 10, No 9, p 1380-1396, September 1973. 13 fig, 3 tab, 34 ref.

Descriptors: *Suspended load, *Estuaries, *St. Lawrence River, Canada, Tides, Sediment yield, Turbidity, Suspended solids, Particle size.

The distribution of total suspended matter in the estuary of the St. Lawrence River was studied by quantitative filtration through membrane filters. Tidal fluctuations in the vertical gradients of suspended load were followed at fixed stations along the estuary. The concentrations varied from nearly 40 mg/liter below Ile d'Orleans, to values less than 1 mg/liter at the downstream end of the upper estuary near the Saquenay River entrance. The tidal mean concentrations for the fixed stations ranged from 20 mg/liter to 2 mg/liter. A turbidity maximum, which develops because of entrapments of particles by the tidal circulation, extends for 100 km below Quebec City. In this zone large vertical gradients changing in intensity with the tide by resuspension of settled material exist above the bottom. The total suspended matter is 60% to more than 90% inorganic by weight, and has a mean particle size between 5 and 7 micrometers. The annual rate of transport of suspended material out of the upper estuary at a section near the Saquenay River is estimated at less than 1 million metric tons. Chemical and mineralogical analyses were performed on 23 suspensoid samples collected by centrifuging large volumes of water. The clay mineral composition of the less than 2 micrometer fraction is on the average 1.5% montmorillonite, 8% kaolinite, 31% chlorite, and 60% illite. However, large time and space variations are found both in the chemistry and mineralogy of the suspended matter. (Knapp-USGS)

Identifiers: *Gulf of St. Lawrence, *Species diversity, *Data interpretation, Species diversity index, Seasonal variation, Probabilistic similarity index, Marine environment, Silicon, Chilomonas, Nitzschia closterium, Peridinium, Pyramimonas, Strombidium, Chaetoceros debilis, Chaetoceros diadema, Chaetoceros laciniosus, Thalassiosira, Nitzschia seriata, Leptocylindrus danicus, Dinobryon, Vertical distribution, Analysis of variance.

Community structure of phytoplankton in Baie des Chaleurs (Gulf of St Lawrence) was investigated by means of an entirely probabilistic procedure; such an approach gives support to the existence of phytoplankton associations, stable over periods of many weeks, that are under the control of such environmental factors as nutrients and temperature. The procedure used for association identification is explained, and its advantages as well as inconveniences are stressed in comparison with more usual techniques. Species diversity is analyzed in relation to the upwelling conditions of the bay, and conclusions are made within the general framework of a prediction of species diversity from biological activity and environmental stability. Consideration of these two factors stresses the significance of time scales involved and suggests that species diversity is the modulation along a time axis of species evenness by species richness. 03. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

PROSPECTS OF INCREASING FRESHWATER RESOURCES IN THE USSR THROUGH DESALTING OF SALINE AND BRACKISH WATERS (PERSPEKTIVY UVELICHENIYA RESURSOV PRESNYKH VOD NA TERRITORII SSSR ZA SCHET OPRESNENIYA SOLENYKH I SOLONOVATYKH VOD),
Vsesoyuznyi Nauchno-Issledovatelskii Institut Vodosnabzheniya, Kanalizatsii, Gidrotekhnicheskikh Sooruzhenii i Inzhenernoi Gidrogeologii, Moscow (USSR).
V. A. Klyachko.
Vodnyye Resursy, No 1, p 173-180, 1972. 5 fig, 1 tab, 6 ref.

Descriptors: Freshwater, *Saline water, *Brackish water, Desalination, *Desalination processes, Distillation, Electrodialysis, Reverse osmosis, Freezing, Solvent extractions, Ion exchange, Crystallization, Desalination apparatus, Desalination plants, Cost-benefit analysis, Forecasting, *Cost analysis.
Identifiers: *USSR.

Desalting processes which show promise in the next 15-20 years are distillation, electrodialysis, reverse osmosis, and freezing. Less suitable processes include crystallization of water in the form of crystalline hydrates of hydrocarbon gases, extraction of water by organic solvents, and removal of salts through use of ion exchangers. Distillation using heat will be employed in southern regions of the USSR to desalt small quantities of saline water containing more than 15

g of salt/liter. Subsurface brackish and weakly saline waters containing 3-12 g of salt/liter will soon be converted to freshwater by electrodialysis and reverse osmosis. The USSR is constructing portable electrodialysis units with a capacity of 20 cu m/day (for desalting water containing 5 g of salt/liter) as well as stationary units with capacities of 12, 25, 50, 120, and 350 cu m/day. About 100 electrodialysis units of varying capacity are currently in operation in the country. Use of desalinized water will be determined by the ratio of the cost of delivering water from the nearest freshwater source to consumer to the cost of on-site desalination. The cost of delivering 1 cu m of water from a freshwater source increases with increasing distance to the place of use and with decreasing daily water consumption. Within the near future the capacity of saline-wastewater conversion installations will reach 1 billion cu m/year. (Josefson-USGS)

ANOTHER RIO GRANDE FOR NEW MEXICO,
Los Alamos Scientific Lab., N. Mex.
L. P. Reinig, R. I. Brasier, B. J. Donham, and W. S. Gregory.
Available from NTIS, Springfield, Va., as CONF-730438-1; $4.00 in paper copy, $1.45 in microfiche. Report CONF-730438-1, April 1973. 12 p, 3 fig, 1 tab, 9 ref.

Descriptors: *Desalination, *New Mexico, *Aquifers, *Feasibility studies, Cost-benefit analysis, Nuclear powerplants, Geothermal studies, Pilot plants, Desalination plants, Saline water.
Identifiers: *Tularosa Valley (N. Mex).

To desalt the several hundred million acre-feet of saline ground water in the Tularosa Valley (New Mexico) at a rate of several million tons per year, a 15-year plan is suggested (the Tularosa-Rio Grande Project). Contingent upon feasibility studies of the use of nuclear or geothermal power in various areas of concern (political and legal, sociological, economic, environmental, and technical), demonstration plants of 1-, 10-, and 1000-million gallons per day would be followed by a 1-billion-gallon-per-day plant that would also generate 2000 mega-watts of electric power. 3B. Water Yield Improvement

MODELING AND SIMULATION OF RESERVOIRS TO PREDICT EVAPORATION REDUCTION BY SURFACE FILMS,
Arizona State Univ., Tempe. Dept. of Chemical Engineering.
C. O. Reiser, and J. L. Adams.
Available from the National Technical Information Service as PB-224 138, $3.00 in paper copy, $1.45 in microfiche. Completion Report, September 1973. 34 p, 13 fig, 14 ref, append. OWRR A-041-ARIZ (1). 14-31-0001-3803.

Descriptors: *Evaporation control, *Monomolecular films, Model studies, Simulation analysis, *Computer models, Alcohols, Antitranspirants, *Reservoir evaporation, *Arizona.
Identifiers: *Evaporation modeling, *Lake Hefner (Ariz).

A computer model based upon an energy budget has been constructed to simulate water evaporation from reservoirs and the effect of adding an antievaporant film. In order to produce a workable model for these initial calculations, simplifying assumptions were made considering heat and mass interchange only at the surface with no lateral flow. Subcooling of the surface is considered to induce vertical mixing of the warmer section below to produce an istothermal epilmnion. The results obtained give a fair match with data measured for Lake Hefner, but give lower temperatures for the hypolimnion and a final yearly temperature slightly lower than the starting temperature. Neglect of circulation effects in the model and the use of average meteorological data may account for these discrepancies. Temperature profiles and evaporation savings have been computed for the application of a film with a specific resistance of three sec./cm. A ten-month continuous film coverage predicts an annual evaporation reduction of 46% but this drops to 27% if the film application is restricted to daytime hours of 9 a.m. to 9 p.m. With an eight-month treatment starting in May, evaporation savings drop to 38% but the same maximum July surface temperature which is 5C. higher than an untreated surface is attained. The winter isothermal reservoir temperature is increased 1C. by a 10-month film cover.

WEATHER MODIFICATION ACTIVITIES IN TEXAS, 1970-72.
Texas Water Development Board, Austin.

Report 175, August 1973. 34 p, 1 tab.

Descriptors: *Weather modification, *Cloud seeding, *Artificial precipitation, Droughts, Rainfall, Meteorology, Water shortage, Irrigation, Water yield improvement.

Since September 1, 1967, all legally performed weather modification activities in Texas have been carried out under the scope and authority of the Texas Water Development Board through the Texas Weather Modification Act (Chapter 14, Texas Water Code). The Act provides for the regulation and proper documentation of all weather modification projects taking place within the State. The weather modification licenses and project permits which have been issued through 1972 are tabulated, and the weather modification activities which took place are described. No attempt is made to analyze the degree of success of these activities. (Woodard-USGS)
W73-14998

THE ROLE OF WEATHER MODIFICATION IN DROUGHT RELIEF,
Bureau of Reclamation, Denver, Colo. Div. of Atmospheric Water Resources Management.
W. E. Howell, and L. O. Grant.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 551-560, 1973. 1 tab, 8 ref.

Descriptors: *Weather modification, *Droughts, *Cloud seeding, Water shortage, Water yield, Meteorology.

Drought mitigation is the focus of some of the largest and most conspicuous efforts in the application of weather modification. Important technical advances during the past 10 years make possible an improved appraisal of the role of weather modification in drought relief. Clouds that exist during drought intervals frequently have characteristics that fall within the 'window' area for which seeding is required for an efficient utilization of cloud water. In arid and semiarid areas the role of weather modification is the augmentation of overall water supplies on a continuing basis. In less arid regions, weather modification should, at least during some droughts, make the difference between catastrophe and the maintenance of a stable economy. (Knapp-USGS)

SALT TOLERANCE AND CATION INTERACTION IN ALKALI SACATON AT GERMINATION,
Sind Univ., Hyderabad (Pakistan). Dept. of Botany.
S. Z. Hyder, and S. Yasmin.
Journal of Range Management, Vol 25, No 5, p 390-392, September 197. 6 fig, 9 ref

Descriptors: *Forage grasses, *Salt tolerance, *Cations, *Germination, *Plant physiology, Semiarid climate, Water supply, Plant growth, Seeds, Osmotic pressure, Magnesium, Sodium chloride, Calcium, Salts.
Identifiers: *Pakistan.

Alkali sacaton (Sporobolus airoides Torr.) is an important forage plant of Southwest U.S. that can grow under natural rainfall, where land is highly saline and adequate water for leaching the salt is not available; therefore, it was chosen for study for salt tolerance and cation interaction for use in semiarid areas of West Pakistan. Results showed that germination was inhibited at a concentration of 275 meq/liter of sodium chloride. Mannitol and other salts at iso-osmotic pressure restricted germination in the following decreasing order: MgCl 2, KCL, CaCl 2, NaCl, and mannitol. Calcium and sodium partially counteracted the inhibitory effects of magnesium on germination. Greater recovery in germination was noted by addition of calcium than sodium in seeds previously treated with a high concentration of magnesium chloride. The role of sodium and calcium in counteracting magnesium effects is discussed, with concluding statements concerning the specific effects of salts which are more important than osmotic effects on seed germination of this species. SALINITY, PLANT GROWTH, AND METABOLISM,
Western Australia Univ., Nedlands. Dept. of Agronomy.
H. Greenway.
Journal of the Australian Institute of Agricultural Science, Vol 39, No 1, p 24-34, March 1973. 6 fig, 3 diag, 3 tab, 61 ref.

Descriptors: *Salinity, *Plant growth, *Metabolism, Water utilization, Agriculture, Arid climates, Semiarid climates, Saline water, Plant physiology, Plant breeding, Electrolytes, Water shortage, Irrigation, Salt tolerance.

Water use for agricultural purposes, in arid and semiarid climates, usually implies the use of saline water. The challenge, then, is to increase the physiological tolerance of plants to saline water. Steps to improve agriculture in saline areas include: assessing large numbers of plant species for their response to salt; plant breeding for salt tolerance before further selection for other characteristics; and the understanding of causes for varietal differences in salt tolerance which

would provide the basis for methods of selection at very early growth stages. Species should be evaluated in terms of causes for growth stimulations and growth reductions with the organism as a whole considered. Understanding how electrolytes and water deficits affect metabolism, along with information on growth and development should be the basis for further study in situations where either specific ion effects or water deficits are indications of salt injury. Physiological research should aim at the elucidation of the mechanisms of salt tolerance of various species especially if irrigation agriculture continues on a world wide scale. This research would further aid in understanding other biological issues, such as the physiology of marine organisms. (Bahre-Ariz.)

LEGAL CONSTRAINTS ON URBAN WATER SYSTEMS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
N. S. Grigg.
Journal of the Urban Planning and Development Division, American Society of Civil Engineers, Vol 99, No UP2, Proceedings paper No 9986, p 137-145, September 1973. 1 fig, 24 ref.

Descriptors: *Water management (Applied), *Systems analysis, Constraints, Legal aspects, Decision making, Water rights, Legislation, *Institutional constraints, *Colorado.
Identifiers: *Urban development, *Denver (Colo).

Both strategic and tactical level decisions regarding urban water management are subject to legal constraints. In a systems study it is desirable to find ways to better a water system such that the level of performance of the system is improved. Legal constraints which inhibit such improvement are classified and their effect on a typical regional water system, e.g., Denver, Colorado is noted. It is shown that a clear statement of goals is necessary in order to formulate a realistic objective function. To speak of 'optimizing' such a function in a general urban sense is overly ambitious at this time because of the severity of the constraints on the system. Consideration of the general issues in a systems framework is useful because it focuses on the important problem areas so that fruitful debate can occur. (Bell-Cornell)

Identifiers: *Steel industry, Chester (Penn.), Middletown (Ohio).

The trend by industrial plants to supply their own water rather than purchase from municipal water systems is examined in five separate subsections of this article, by authors who argue different viewpoints. Hardman reviews legislative controls over water supplies in New Jersey. The entire state is now under regulatory control for groundwater development. Users of ground and surface water in excess of 70 gpm are required to report monthly or daily usage. Since this appears to be larger than necessary to provide for normal true riparian uses it may be possible to reduce it to 35 gpm. Appleyard discusses the economic advantages for Chester, Pennsylvania, and for industries in industrial utilization of public water supplies. Laffey asserts that most industrial plants are

not interested in supplying and treating their own water because of high capital investment costs. Boehm explains that after consideration of four factors-- (1) cost of purchased water vs. own supply, (2) availability of each, (3) quantity and quality required, and (4) various uses of water within the plant--Armco Steel of Middletown, Ohio decided to provide its own water supply and treatment facilities. Finally, Stewart advances points similar to Boehm's which should be considered by industry before deciding on a private or public water supply. Additionally, utilities should consider unused capacity, stabilization of overall-load factor, potential demand, capital improvement costs, and potential revenues before servicing industries. MARGINAL VALUES OF WATER USED IN THE IRRIGATION OF CITRUS IN THE CENTRAL RIDGE SECTION OF FLORIDA,
Florida Univ., Gainesville. Dept. of Food and Resource Economics.
D. B. Wilder, III.
Available from the National Technical Information Service as PB-223 804, $7.00 in paper copy, $1.45 in microfiche. M Sc Thesis, 1972. 88 p, 7 fig, 11 tab, 29 ref, 3 append. OWRR B-007-FLA (5). 14-31-0001-3267.

Descriptors: *Water allocation (Policy), Water values, Water utilization, Water demand, Decision making, *Florida, *Citrus, Irrigation, Crop production, Marginal productivity, *Regression analysis, Marginal benefits, *Marginal costs.

The objective was to estimate the value of water used in the irrigation of citrus in the Central Ridge Section of Florida. Production functions were estimated to explain the relationship of irrigation water to citrus yields. Marginal value productivities were calculated from these estimated relationships. Two sources of data were used: yield and irrigation records for citrus plots at the Lake Alfred Agricultural Research and Education Center, and a citrus irrigation response study at Lake Alfred by R. C. J. Koo. Least-squares regression techniques were used to estimate response coefficients from yield data for the period of January, 1930, through June, 1956. The 1960-61 crop year through the 1967-68 crop year were used from the study made by Koo. Estimates of the marginal value of irrigation water per acre-inch for four selected time periods ranged from $7.23 to $148.39 for the plot data and from $6.51 to $20.64 for the study by Koo. WATER TABLE CONTROL WITH SUBSURFACE IRRIGATION,
North Carolina State Univ., Raleigh Dept of Biological and Agricultural Engineering
R. W. Skaggs.
Paper No. NA72-205 presented at 1972 Annual Meeting - North Atlantic Region, American Society of Agricultural Engineers, Univ. of Maryland, College Park, August 13-15, 1972. 22 p OWRR A-033-NC (5)

Descriptors: *North Carolina, *Irrigation design, *Subsurface irrigation, *Drainage systems, *Subsurface drainage, Soil-water-plant relationships, Surface-groundwater relationships, *Soil water movement, Water table, Coastal plains.

Field experiments were conducted to characterize soil-water movement during sub-irrigation on a Lumbee sandy loam soil. Results for the water table response to sub-irrigation are presented and compared to predictions from theoretical approaches. Solutions were presented for the water table response to sub-irrigation for both initially draining and horizontal profiles. Numerical procedures were used to solve a nonlinear differential equation for saturated soil-water movement. A solution to the linearized equation was also presented and compared to the numerical results. The results of experiments showed that water could be supplied to the root zone at a rate more than sufficient to satisfy plant needs for 7.5 and 15 m tile spacings. However, the response was too slow for the 30 m tile lines. Theoretical calculations showed that the suggested water table depth range of 60 to 90 cm could be maintained in this soil with a tile spacing of 19.1 m.

IRRIGATION CANAL SYSTEM CAPACITY DESIGN CRITERIA,
Harza Engineering Co., Chicago, Ill.
J. D. Earles.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 99, No IR3, Proceedings paper No. 9973, p 227-235, September 1973. 1 fig, 2 tab, 4 ref.

Descriptors: *Canals, *Design, *Irrigation practices, *Land tenure, *Land use, Estimating, *Evapotranspiration, Irrigation systems, Irrigation water, Water requirements, Water delivery, Irrigation efficiency, Farms.
Identifiers: Capacity criteria, *Cropping patterns, *Iran (Khuzestan), Crop yield.

Estimates of peak period evapotranspiration requirements for projected cropping are used to determine the minimum capacities necessary for main and secondary canals. In irrigation project design, the peak period of consumptive use is the period during which the weighted average daily rate of evapotranspiration of the various crops grown in the project areas is at a maximum. Different crops may have their peak rates at different times. To provide water when and where needed, at minimum cost, a detailed evaluation is necessary to prevent over- and under-design of canals. Land tenure after project construction is an important factor in determining the required capacity of project irrigation canals. An example of this factor is demonstrated in the Khuzestan area of Iran which has undergone a recent change in Government land tenure policy. The policy of subdividing project lands into small parcels for lease or sale to farmers was changed to permit an agribusiness lease-type of operation during initial project development. This change caused an increase in the projected summer cropping intensities, resulting in higher peak irrigation water requirements. To deliver the additional water, canal capacity increases of up to 50 percent was required over the original design. (Bell-Cornell)

THE EFFECTS OF RAINFALL AND SHADE ON THE OCCURRENCE OF THREE MITE PESTS OF TEA IN CEYLON,
La Trobe Univ., Bundoora (Australia) Dept of Zoology
W. Danthanarayana, and D. J. W. Ranaweera
Ann Appl Biol. Vol 70, No 1, p 1-12, 1972. Illus.
Identifiers: Brevipalpus-Californicus, Calacarus-Carinatus, *Ceylon, *Mite pests, Oligonychus-Coffeae, Rainfall, Shade, *Tea.

Outbreaks of the red spider mite (Oligonychus coffeae Nietn.), the purple mite (Calacarus carinatus Green) and the scarlet mite (Brevipalpus californicus Banks) of tea were closely associated with the monthly rainfall pattern. Peak numbers occurred during the intermonsoonal dry periods. The relationship between mite numbers and the rainfall pattern suggested that control measures should commence at the end of the first month after the dry season begins. More red spider mites, but fewer purple mites, occurred on tea grown under shaded conditions. Observations on the relationship between scarlet mite numbers and shade were inconclusive. It is suggested that, in addition to direct effects of rainfall and shade, mite numbers are determined by certain biochemical processes that take place within the tea leaves.--Copyright 1973, Biological Abstracts, Inc.

SOME MEASURES OF AGRICULTURAL DROUGHT,
Agricultural Research Service, Beltsville, Md.
D. M. Hershfield, D. L. Brakensiek, and G. H. Comer.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 491-502, 1973. 7 fig, 3 tab, 7 ref.

Descriptors: *Droughts, *Climatology, *Distribution patterns, Meteorology, Agroclimatology, Water shortage, Statistics, Statistical methods, Data collections, Meteorological data, Climatic data, Weather data.

To a large extent agriculture exists in a climatic environment of uncertainty. This is particularly true in the mid-latitudes which experience a procession of highs and lows that move from west to east and give rise to daily weather changes. A normal climate, as given by the mean values, does not exist, and information concerning the extremes is often more important for agriculture than the average conditions. Thus, it is important to know how often such extremes occur. The frequency of dry-day sequences is proposed as a measure of agricultural drought. The occurrence and severity of the drought depends upon the length of the sequence in combination with the water content and water holding capacity of the soil and the water-use pattern of the crop. The observed distribution of dry-day sequences can be represented closely by the geometric distribution. Since the average sequence length is highly correlated with the number of precipitation days, the one parameter required for the geometric distribution can be obtained from data published in climatic summaries. (Knapp-USGS)

A METHODOLOGY FOR ANALYSING AGRICULTURAL DROUGHT,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.

V. J. Bidwell.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 515-522, 1973. 8 ref. NSF Grant GK-11564.

Descriptors: *Droughts, *Agroclimatology, *Mathematical models, Statistical models, Regression analysis, Least squares method, Water shortage, Data collections, Climatic data, Weather data.

The concept of agricultural drought is discussed in relation to some aspects of plant physiology. The relationship between hydrologic variables and agricultural products is considered a system and can be modeled on this basis. There are two important considerations in the construction of a model for droughts: (1) the model should predict zero yield when devastating conditions occur, for instance, no rain for two months; and (2) possible interaction between different time periods should be considered, to see if growth during a particular period is affected by water stress during a previous time period. The parameters can be evaluated by the method of nonlinear least squares. (Knapp-USGS)

INTERREGIONAL COMPETITION IN THE CATTLE FEEDING ECONOMY, WITH SPECIAL EMPHASIS ON ECONOMIES OF SIZE,
Texas A and M Univ., College Station. Dept. of Agricultural Economics and Rural Sociology.
R. A. Dietrich.
Texas Agricultural Experiment Station Bulletin B-1115, September, 1971, 55p, 8 fig, 39 tab. HM-2489.

Descriptors: *Feed lots, *Cattle, *Economics, *Size.
Identifiers: Regional production characteristics, Transportation rates, Least-cost shipment routes, Feed grains.

This study utilizes a multi-dimensional transhipment model to determine the least cost location and optimum levels of cattle feeding and fed-cattle slaughter among 27 specified regions in the 48 contiguous states to satisfy the demand for fed beef. Data showed that readily available supplies of feed grain and feeder cattle and economies of size in feedlot operations are of major importance in determining the optimum location and levels of cattle feeding. Models were also developed to sysytematically measure the effects of specified changes in regional feedlot size and projected 1975 regional feedlot sizes on the optimum regional location and levels of cattle feeding and slaughter. In addition, the study shows the least-cost shipment routes for feeder cattle, feed grains, fed slaughter cattle, and dressed fed beef to meet the demand requirements in the various sectors of the cattle feeding-fed-beef economy. INFLUENCE OF IRRIGATION ON OVERWINTER SURVIVAL OF THE PINK BOLLWORM,
Arizona Univ., Tucson. Dept. of Entomology.
J. E. Slosser, and T. F. Watson.
Environ Entomol. Vol 1, No 5, p 572-576, 1972.
Identifiers: *Bollworm (Pink), Cocoon, *Irrigation, Larvae, Moth, Pectinophora-Gossypiella, Soil moisture, Winter survival.

Winter survival of Pectinophora gossypiella (Saunders) was studied in relation to timing of irrigation treatments, with applications ranging from Jan. 5 to May 10, 1967, including a nonirrigated control and 2 methods of larval burial. Of 4200 larvae buried at the 6-in. soil depth, only 1.3% survived. No significant differences existed among irrigation treatments, but larval survival was significantly greater in buried bolls than in buried, free cocoons. Moth emergence appeared to be related to soil moisture and compaction. Approximately 75% of the moth emergence was suicidal, and significantly more males than females survived.--Copyright 1973, Biological Abstracts, Inc.

AUTOMATED IRRIGATION IS HERE,
Washington State Univ., Prosser. Cooperative Extension Service.
M. A. Hagood.
Agricultural Engineering, Vol 53, No 10, p 16-18, October 1972. 2 tab, 7 ref.

Descriptors: *Sprinkler irrigation, *Trickle irrigation, *Irrigation operation and maintenance, Irrigation systems, Furrow irrigation, Irrigation efficiency, Irrigation engineering, Water management (Applied), Automation, Distribution systems, Costs, Surface irrigation.

Displacement of rural Americans is an inevitable consequence of irrigation technology that will continue to displace inefficient equipment and labor; however, this new technology will add to the total growth, efficiency, and competitiveness of irrigated agriculture. Low-skilled labor is now being replaced with better trained, better paid, and more dependable managerial personnel. New irrigation systems make possible development of previously considered non-irrigable land. Trickle irrigation allows use of low quality water, as sprinkler irrigation allows waterflow management which can significantly affect sediment concentration, nutrient content, and overall water quality of return flows. Automation of surface systems in open channels maintains uniform water levels, in addition to a 30 percent savings in water use. The costs of owning and operating selected sprinkler systems are presented and as the beneficial aspects of type and automation level of various systems are discussed. (Bahre-Ariz.)

DIURNAL WATER STRESS IN PLANTS GROWN ON A COARSE SOIL,
Commonwealth Scientific and Industrial Research Organization, Wembley (Australia). Div. of Plant Industry.
B. A. Carbon.
Australian Journal of Soil Research, Vol 24, No 1, p 33-42, March 1973. 7 fig, 3 tab, 17 ref.

Descriptors: *Diurnal, *Moisture stress, *Plant growth, *Sorghum, Sprinkler irrigation, Crop production, Coarse sediments, Water supply, Irrigation effects, Plant physiology, Water utilization, Soil water, Evaporation, Leaves, Root zone.

Two hybrid sorghums were grown on coarse deep sand under various sprinkler irrigation regimes. Bulk soil water potentials under all treatments remained in the range of 0 to -1000 cm throughout the experiment. Data indicate that a low rate of supply of soil water in the root zone can impose significant stress on those plants even when soil water potential is greater than -1 bar. Measurements of leaf water potential showed a rapid diurnal change from no plant water stress at dawn, to large negative potentials in midafternoon. It is concluded that, at least in part, this stress is sufficient to cause reductions in growth and water use, bec use of the unavailability of soil water to meet the potential demand of the plant. Diurnal water stress at higher levels resulted in the yield and tiller number per plant being reduced, and the time to flowering of grain sorghum extended. It is further noted that although the surface layers were prone to direct evaporation to the atmosphere, and despite the high degree of plant water stress, soil water potentials remained in a -35 to -50 cm range. (Bahre-Ariz.)
W73-15216

AN ECONOMIC COMPARISON OF SHORT AND FULL SEASON COTTON PRODUCTION IN ARIZONA,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
G. S. Willett, B. B. Taylor, and D. R. Buxton.
Arizona Agricultural Experiment Station, Research Report 269, August 1973, 15 p, 4 fig, 17 tab, 9 ref.

Descriptors: *Cotton, *Comparative costs, *Cost-benefit analysis, *Period of growth, *Crop production, Agronomic crops, Fiber crops, Field crops, Economics, Costs, Feasibility studies, Optimization, *Arizona, Irrigation, Insecticides, Return (Monetary).

Economic consideration of early versus late crop termination is studied to aid Arizona cotton producers. Under adopted assumptions, substantial net income changes accompanied termination alternatives (irrigation, insecticide application, defoliation, picking, and completion of harvesting and shredding). Assuming a base lint price of 40 cents, a 15 percent yield loss, and Salt River Project irrigation costs, early termination resulted in an annual per acre net income change that ranged from $16.24 (Alternative I) to -$68.20 (Alternative IV). The range becomes even wider when yield losses are allowed to vary from zero yield loss to 40 percent yield loss, indicating that advantages offered by early termination are highly dependent upon yield losses expected to accompany various termination dates. Full season cotton costs can be identified with sufficient precision, although additional returns that can be expected from these outlays is highly uncertained. Environmental, biological, and cultural factors in different locations and different time periods make it inadvisable to recommend that early termination is, or is not, a profitable practice. Assessment of each situation is up to the individual grower; however, guidelines are developed which indicate the change in profitability from early termination, noting the expected impact on business performance with the realization that substantial yield losses can be realized while still permitting increased profits. (Bahre-Ariz.)

DEW OVER INDIA AND ITS CONTRIBUTION TO WINTER-CROP WATER BALANCE,
Meteorological Office, Poona (India).
C. R. V. Raman, S. Venkataraman, and V. Krishnamurthy.
Agricultural Meteorology, Vol 11, No 1, p 17-35, January 1973. 7 fig, 2 tab, 14 ref.

Descriptors: *Dew, *Microenvironment, Seasonal, Frequency analysis, Rates, Water supply, Soil moisture, Soil moisture meters, Crop production, Crop response, Semiarid climates, Arid climates, Evaporation, Transpiration, *Water balance, Leaves, Absorption.
Identifiers: *India.

Dew observations made with Duvdevani recorders, at about 60 stations in India, 1968-1971, are analyzed to study seasonal frequency and total accumulation, to assess the extent to which dew accumulation could mitigate water deficiency in winter, and augment soil moisture for possible agronomic exploitation. Tabulated data from the sites distributed all over India provide dew measurement estimated by comparison of deposition patterns at various levels above ground. Dew relation to vegetation can be beneficial with absorption of dew by leaf surfaces for direct use by plant; reduction of transpiration for bedewed plants resulting in equivalent saving of soil moisture reserve; and water saturation from dew of a plant during night leading to significant photosynthesis during the early morning hours. With the above data an attempt is made to assess the extent of dew accumulation as a supplement to the moisture need of winter crops over India. Water stress was worked out for January, by measuring potential

evapotranspiration, normal precipitation for a selected network. Although dew was beneficial along networks with 3-7 mm measured, only 1-2 mm was recorded in dry-farming tracts, with moisture stress increasing southward from 50-80 mm around 27 degrees N to 125 mm near 12 degrees N. In semiarid and arid dry farming areas dew deposition is too small to contribute to soil moisture conservation. (Bahre-Ariz.)

COMPARATIVE DROUGHT RESISTANCE OF BOS INDICUS AND BOS TAURUS CROSSBRED HERDS IN CENTRAL QUEENSLAND. RELATIVE MORTALITY RATES, CALF BIRTH WEIGHTS, AND WEIGHT CHANGES OF BREEDING COWS,
Commonwealth Scientific and Industrial Research Organization, Rockhampton (Australia). Cattle Research Lab.
J. E. Frisch.
Australian Journal of Experimental Agriculture and Animal Husbandry, Vol 13, p 117-126, April 1973. 8 tab, 20 ref.

Descriptors: *Animal growth, *Dry seasons, *Nutrient requirements, *Cattle, *Drought tolerance, Livestock, Environmental effects, Breeding, Moisture stress, Growth rates, Water supply, Water shortage, Arid lands, *Australia, Drought resistance, Mortality.

The northern Australian beef industry is dependent on selection of various strains or breeds that have shown the ability to survive and produce efficiently in a region subject to prolonged periodic droughts and to poor nutrition during the dry season of most years. Weight changes and associated effects of drought on comparable groups of Zebu crossbred cows viewed at Belmont, Queensland, during a drought in 1969, were measured on all cows, with a consideration that about half of the cows calved over a two-month period from mid-October. All the cows were weighed three times, with the weights and weight changes of both the calving and non-calving groups following a similar pattern; though the weight changes of the non-calving group were of greater magnitude; the weights of the three crossbreds were the same at maturity, but achieved at different rates. During the drought, the purebred Brahmans lost the least and the purebred Africanders lost the most weight of all breeds. However, the nature of the data precludes drawing any strict comparisons. Mortality rates recorded 1960-1969 were generally highest for Shorthorn x Herford (SH), particularly in the drought years of 1965 and 1969. Reasons which might explain the differences in performance of the breed types are presented. (Bahre-Ariz.)

Descriptors: *Sprinkler irrigation, *Irrigation practices, Crop production, Arid climates, *California, Spatial distribution, *Vegetable crops, Salt balance.
Identifiers: *Imperial Valley.

In the arid Southwest where irrigation is a necessity, large increases in Long Imperator carrots, Climax lettuce, Calicel lettuce, Scarlet Globe radishes, and Yellow Granex onions have been made possible by sprinkler irrigating plants grown in flat beds using grid spacings with two inch variance ranging from 10x10 to 24x24. Sprinkler irrigation is important in the arid Southwest to prevent salt accumulation on the seed row surface until the seeds emerge. After emergence, the seedlings are then furrow irrigated, allowing the portable solid set sprinklers to be used in another field. Research indicates that if all irrigation were done by sprinklers, the furrows could be eliminated. Plants are being grown in various grid patterns to identify those that produce the highest marketable yields at the highest degree of uniformity. (Bahre-Ariz.)

RICE CULTIVATION IN SOUTHERN KAZAKHSTAN KZYLKUMSKY RIDGE, (IN RUSSIAN),
Novocherkasskii Inzhanerno-Meliorativnyi Institut (USSR).
B. A. Shumarov, and A. G. Rau.
Dokl Akad S-Kh Nauk. 1 p 6-7, 1972, Illus.

Descriptors: Cultivation, *Irrigation, *Rice cultivation, Ridges, *USSR (Kazakhstan).

Five variations of UZROS-13 rice were used in a developmental study of growing conditions. The quantity of water consumed by the most suitable variant during the growing stages was 306-443 m3/quintal or 78-83% of the control group. The watering period was reduced to 10-15 days and irrigation norm to 2500-3000 m3/ha.--Copyright 1973, Biological Abstracts, Inc.

THE EFFECT OF DROUGHT, IRRIGATION AND MINERAL FERTILIZATION ON THE GROWTH OF THE ROOT SYSTEM OF SOYBEAN PLANTS, (IN RUSSIAN),
A. A. Babich.
Dokl Akad S-Kh Nauk 1 p 16-19, 1972, Illus.
Identifiers: *Drought, Fertilization, Growth, Irrigation, *Minerals, Plants, *Soybean root system.

Occasional short term drought in July and Aug. had no adverse effect upon the soybean plants. During drought years the root system growth of 3 cultivars increased and penetrated deeper into the soil than in other years. The depth of penetration and the strength of root development was also greatly influenced by irrigation and mineral fertilization.--Copyright 1973, Biological Abstracts, Inc.

INFLUENCE OF IRRIGATION ON THE YIELD AND PERSISTENCE OF FORAGE LEGUMES,
Ministry of Agriculture and Lands, Kuala Lumpur (Malaysia). Div. of Agriculture.
H. A. Wahab, and D. S. Chamblee.
Agron J. Vol 64, No 6, p 713-716. 1972.
Identifiers: Coronilla-Varia, Disease, *Forage legumes, *Irrigation, Legumes, Medicago-Sativa, Trifolium-Repens, *Crop yield, Alfalfa, Clover, Crownvetch, Soil moisture.

The effect of irrigation on the yield of 3 alfalfa (Medicago sativa L.) cultivars, corwnvetch Coronilla varia L.) and ladino clover (Trifolium repens L.) was studied in the field over a 2-yr period. The nonirrigated plants received natural precipitation, whereas the irrigated legumes were supplied with supplemental water in addition to the rainfall whenever soil moisture was depleted to approximately 50% of the available water holding capacity. At the first harvest after irrigation in the first yr, superior growth of all legumes was obtained by the use of supplemental water. The benefits of irrigation to some species and cultivars ended at this point. Yields of alfalfa were sharply reduced in mid- and late summer of the second yr as a result of irrigtion. Irrigation of the 3 alfalfa varieties resulted in an overall decrease in yield of 76% at the last harvest. The alfalfa varieties responded differentially to irrigation. Most of the stand of crownvetch was lost following the first cut on the irrigated plots. In contrast to other legumes, irrigation increased the yields of ladino clover by approximately 19%. Severe infestation by several diseases was probably a primary factor in the severe stand loss and low yields of alfalfa and crownvetch under irrigation. Excessive soil moisture due to precipitation soon after irrigation also possibly contributed to the loss of alfalfa stands.--Copyright 1973, Biological Abstracts, Inc.

STOMATAL RESISTANCE, NET PHOTOSYNTHESIS AND TRANSPIRATION IN PMA-TREATED SORGHUM: A FIELD STUDY,
Texas A and M Univ., Beaumont Agricultural Research and Extension Center.
J. W. Sij, E. T. Kanemasu, and I. D. Teare
Crop Sci. Vol 12, No 6, p 733-735. 1972. Illus.
Identifiers: Analyzers, Diffusion porometry, Phenylmercuric acetate, *Photosynthesis, *Sorghum-Bicolor, *Stomatal resistance, Transpirant, *Transpiration.

Diffusion porometry and a field-chamber system were employed to study the effects of single applications of 90-720 micro M phenylmercuric acetate (PMA) on stomatal resistance, photosynthesis, and transpiration in field-grown sorghum (Sorghum bicolor (L.) Moench). To maintain increased stomatal resistance up to 20 days it was necessary to apply at least 360 micro M PMA. In short-term studies of 3-4 days post-treatment, photosynthesis was reduced (at least temporarily) more than was transpirations by PMA concentrations that produced prolonged effects on stomata. Diffusion porometry and field chambers can be used to test other antitranspirants applied to field-grown crops.--Copyright 1973, Biological Abstracts, Inc.

dentifiers: *Harvesting (Aquatic weeds), *Har-estors (Machinery).

he object was to investigate the flow and energy quirements for chopping fresh water hyacinths. he basic unit tested was an International 350 orage Harvester. The machine has both a feed echanism and a cutting unit. For this study the vo were powered through separate sources so ch could be varied independently. Tests were nducted using various feed rates, lengths of cut, eed of cutting blades, discharge conditions, feed echanisms and sheer bar clearance. The capacity the forage harvester was more dependent upon e feeding mechanism than the power available to ive the unit. The average horsepower consumed as related to the feed rate expressed in tons per inute by the formula P ± 35.2 F + 2. The capaci-of the unit could be increased with a different pe of feed mechanism. LOOD CONTROL IN RESERVOIRS AND TORAGE POUNDS,
heffield Univ. (England).
. J. Sarginson.
ournal of Hydrology, Vol 19, No 4, p 351-359, ugust 1973. 2 fig, 3 tab, 6 ref.

Descriptors: *Flood control, *Flood routing, Hydrographs, Routing, Equations, Flood forecasting, Reservoirs, Reservoir operation, *Spillways.

By approximating a natural flood hydrograph to a single mathematical curve, the routing procedure may be reduced to a dimensionless differential equation. The computer solution, in the form of a pair of tabulated functions, enables the length of spillway necessary to produce any desired reduction in the peak flood or any desired limiting head on the spillway to be obtained in a single calculation. Only a very slight modification of the procedure is necessary to deal with a spillway having a variable coefficient, or with a reservoir having a variable surface area. (Knapp-USGS)

TESTING OF METHODS FOR DETERMINATION OF URBAN RUNOFF,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
C. N. Papadakis, and H. C. Preul.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY9, Paper 9987, p 1319-1335, September 1973. 9 fig, 2 tab, 19 ref. EPA Grant 11024 DQU.

Descriptors: *Urban hydrology, *Urban runoff, *Storm runoff, *Reviews, Urbanization, Storm water, Cities, Rational formula, Mathematical models, Rainfall-runoff relationships, *Urban drainage, Model studies.

A brief review of methods developed for the calculation of urban storm-water runoff is presented. The Chicago Method, the Road Research Laboratory Method, the EPA Storm Water Management Model, and the University of Cincinnati Urban Runoff Model were tested in three urban watersheds: Chicago 10-acre tract, Oakdale 12.9-acre drainage area, and Bloody Run 2,380-acre urban watershed. All four methods successfully simulate storm-water runoff hydrographs in the case of the two small drainage areas. Runoff hydrographs obtained from (EPA) Storm Water Management Model and the University of Cincinnati Urban Runoff Model are compared with recorded hydrographs at the outlet of the Bloody Run Sewer Watershed at Cincinnati, Ohio. The estimate of the infiltration capacity to be used in these models is of predominant importance in the case of large urban drainage areas. (Knapp-USGS)

Descriptors: *Stratified flow, *Density stratification, Numerical analysis, Reservoir releases, *Withdrawal, Viscous flow, *Sinks, *Hypolimnion.

A theoretical study was made of the fundamental behavior of nondiffusive, viscous flow to a sink located at the bottom of a density-stratified reservoir. The governing partial differential equation was transformed into an ordinary differential equation by utilizing a similarity technique. Numerical and series solutions predict a flow field characterized by a withdrawal layer near the reservoir bottom moving toward the sink. This layer is bounded above by a narrower reverse flow with a much smaller volumetric discharge. Normalized profiles of horizontal velocity, vertical velocity, and horizontal shear are similar, that is they have shapes that are independent of the fluid and flow parameters. Mathematical expressions were developed for various aspects of the fluid motion such as horizontal and vertical velocity, horizontal shear, withdrawal layer thickness, and the distribution of flow within the withdrawal layer. Identifiers: USSR, *Aral Sea.

In recent years there has been a rapidly growing interest in the Aral Sea as a result of development of productive resources in the Aral Sea basin and increasing use of irrigation water in the Syradar'ya and Amudar'ya River basins. Attention is focused on the status and development of water management in these basins, and a forecast is prepared of fluctuations in the level of the sea for a 15-year period between 1971 and 1985. Research on the Aral Sea is classified into three categories: (1) water resources of the Aral Sea basin and problems of their rational use; (2) regime of the Aral Sea during reduced inflow of stream waters, and effect of lowering of the surface level of the sea on environment and economy of the region; and (3) diversion of runoff from Siberian rivers to Soviet Central Asia and its effect on the sea's regime. Identifiers: *Nestos River basin (Greece-Bulgaria), Operation rules.

Optimizing the water resources of a watershed, or a region of a country, necessitates finding the best reservoirs from the point of view of volume and serviceable damsites. Such conditions should be searched for intensively along the river, and topographical and photogrammetric data should be carefully studied. The Nestos River basin, found in Greece and Bulgaria, has been analyzed for the optimum development of its water resources. The aim is the development of the River for hydroelectric power, subject to an irrigation water supply constraint. Presented are detailed results of this analysis, and the mathematical simulation and cost-benefit analysis used to derive the optimum operating policy are described. The results allow for a selection of the unique combination of variables which define the best river development, such as type of scheme, dam heights, and installed capacities. A model incorporating operation rules has been formulated to simulate the operation of the reservoirs and power plants over a time period using river flow records. This model calculates the cost of the project, determines the value of the power and energy output, and so provides a cost-benefit analysis of the particular scheme under analysis. The model has been translated into a computer program in Algol, run on a Univac 1108, and is a collection of sub-routines described in detail. (Bell-Cornell)

MULTILAKE RIVER SYSTEM OPERATION RULES,
New York State Dept. of Environmental Conservation, Albany. Water Management Planning.
C. Liu, and A. C. Tedrow.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY9, Proceedings paper No. 10021, p 1369-1381, September 1973. 8 fig, 1 tab, 10 ref, 3 append.

Descriptors: *River systems, *Lakes, *Dynamic programming, *New York, *Reservoir operation, Optimization, Hydraulics, *Multiple-purpose projects, Management, Water requirements, Systems analysis, Mathematical models, Equations, Cost analysis, Inflow, Computer programs.
Identifiers: Operation rules, *Oswego River System (NY), Finger Lakes (NY), Multiple regression analysis, Multivariable pattern search technique, Random sampling.

Seasonal operation rules for a multilake river system under multiuse requirements are derived utilizing a combination of dynamic programming and the multivariable pattern search technique. The model is formulated to handle linear and nonlinear objective functions. With the application of a river systems transition function, the optimization problem is reduced from a three-decision to a two-decision vector problem. The problem of dimensionality is resolved by employing functional equations expressed in analytical form; multiple regression analysis and random sampling techniques add to the computation efficiency and accuracy of the analysis. The application to the Oswego River System with five major lakes in system-basis operation is described. Two sets of lake-system operating rules are established from the analysis: The lake rule curves and the lake-use priority curves. The effects of system inflow variations and system operation measuring criteria upon the rules are also examined. (Bell-Cornell)

SIMULATION IN WATERSHED PLANNING,
Southeastern Wisconsin Regional Planning Commission, Waukesha.
S. G. Walesh.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99 No HY9, Proceedings paper No. 10020, p 1383-1399, September 1973. 3 fig, 17 ref.

Descriptors: *Watershed management, *Simulation analysis, *Flood control, Hydraulics, Planning, *Water management (Applied), Watersheds (Basins), Hydrology, Flood plains, Computer programs, Digital computers, Surface waters, Mathematical models, Systems analysis, *Wisconsin.
Identifiers: *Milwaukee River (Wis).

Hydraulic and hydrologic simulation is an effective technique in comprehensive watershed planning and in subsequent plan implementation. The need and rationale for simulation are considered, as is the use of existing readily available computer programs. Examples drawn primarily from completed watershed studies illustrate how simulation may be utilized during the watershed planning process for: Floodland delineation, computation of monetary flood damages, evaluation of hydraulic adequacy of river crossings, analysis of structural flood control alternatives, determination of land use effects, and synthesis of low flows. Applications of simulation in plan implementation include: Floodway determination, encroachment studies, provision of design data for river crossings, preparation of flood insurance reports, incorporation of improved mapping and watershed changes, dissemination of flood hazard information, and flood forecasting. Much of the material is drawn from the watershed planning and implementation efforts of the Southeastern Wisconsin Regional Planning Commission. (Bell-Cornell)
W73-14910

LEAST-COST DESIGN OF WATER DISTRIBUTION SYSTEMS,
Western Australia Univ., Nedlands. Dept. of Civil Engineering.
T. Watanatada.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY9, Proceedings, paper No 9974, p 1497-1513, September 1973. 5 fig, 3 tab, 21 ref, 2 append.

Descriptors: *Water distribution (Applied), *Pipes, *Design, *Cost-benefit analysis, *Water supply, Hydraulics, *Networks, Optimization, Engineering, Systems analysis, Mathematical models, Equations.
Identifiers: *Nonlinear programming, Cost minimization, Waterworks, Sensitivity analysis.

A least-cost method for designing water distribution systems is presented. It is a computer-based automatic design method which, given a network configuration, will simultaneously compute the pipe sizes and pumping capacities that minimize the total cost, while satisfying the demand requirements. Basically, the behavior of a network obeys two physical laws: (1) The conservation of headloss around any loop, and (2) the continuity of fluid flow at any pipe junction. From these physical laws and from the performance criteria that the pressure at the delivery points of the network must be above a specified level, a nonlinear programming problem is formulated, in which the cost of the system is to be minimized subject to equality and inequality constraints. Because of their simplicity, the inequality constraints are eliminated by a transformation of Box, from which Haarhoff and Buys' method for equality constraints is used to solve the remaining part of the problem. The computer program can readily handle existing or predetermined system components and can account for the cost of supplying water at the source nodes. Various sensitivity analyses are made on a model network, yielding results which can be useful to complex systems. Tests have shown that the method produces significantly more economical results than conventional designs. (Bell-Cornell)

Vodnyye Resursy, No 2, p 113-137, 1972. 4 fig, 2 tab, 50 ref.

Descriptors: *Runoff, *Variability, *Fluctuations, *Regulation, *Water utilization, Streamflow, Discharge (Water), Runoff forecasting, Analysis, Mathematical studies, Probability, Stochastic processes, Statistics, Curves.
Identifiers: USSR.

Original hydrologic concepts serving as a basis for the modern theory of water regulation and use are examined. Role of the doctrine of streamflow in the general theory of water management is defined, and attention is focused on predicted trends in modern hydrologic analysis. Sources of information on runoff and methods of expanding and refining this information are discussed. Patterns of runoff variability are analyzed, and the possibility of studying natural long-term fluctuations of runoff as a stationary stochastic process is justified. Methods of mathematical expression of random runoff fluctuations are presented, and the growing need to consider anthropogenic influences on runoff in hydrologic investigations is noted. Long-term runoff fluctuations of the Dnieper, Danube, and Rhine Rivers and water

discharges during first and second halves of their observation periods are graphed. (Josefson-USGS)

DAYS CREEK LAKE PROJECT, SOUTH UMPQUA RIVER, DOUGLAS COUNTY, OREGON, (FINAL ENVIRONMENTAL STATEMENT).
Office of the Chief of Engineers (Army), Washington, D.C.

September, 1972. 118 p, 2 maps, 10 ref, 2 append.

Descriptors: *Damsites, *Environmental effects, *Oregon, Reservoirs, Salmonids, Flood control, Augmentation, Rockfill dams.
Identifiers: *Environmental Impact Statements, Chinook, Umpqua, South Umpqua, Douglas County (Ore.), *Days Creek (Ore).

The environmental effects are assessed of a proposed rockfill dam which would create a 480,000 acre-foot, multiple-purpose reservoir, primarily for flood protection in the Umpqua Basin. Adverse environmental impacts include inundation of 16 miles of main stream and 14 miles of tributary stream, with total land and water area of 4,270 acres, and loss of wildlife habitat including natural spawning grounds for 3,350 anadromous salmonids. Positive effects include flood protection; 1,200 acres acquired as part of the project for wildlife habitat; downstream water quality improvement; and enhancement of recreation, fish life and aesthetics resulting from use of the reservoir for low flow augmentation. Water above the dam would also be used for recreation, municipal and industrial water supply, and irrigation. Population of salmonids and spring chinook would be greatly increased. Single-purpose alternatives of flood plain zoning, evacuation, levees, dry reservoir operation, alternative means of irrigation and water supply, and multiple-purpose alternatives of dams with other sites, sizes and types were considered, but were rejected. Included is a summary of comments from 39 Federal, State and local public agencies, conservation groups and individuals, along with responses by the Corps of Engineers. Comments overwhelmingly favored the project, although much support was qualified pending results of turbidity studies and analysis of the final impact statment. Comments received, selected bibliography and project maps are appended. (Stein-North Carolina)
W73-15017

SUMMARY OF A REPORT TO THE SANTA CLARA COUNTY FLOOD CONTROL AND WATER DISTRICT ON THE BAYLANDS SALT WATER FLOOD CONTROL PLANNING STUDY.
Santa Clara County Flood Control and Water District, San Jose, Calif.

January, 1973. 22 p, 6 fig, photos.

Descriptors: *Flood protection, *Land subsidence, *Salt marshes, *Seashore, *Levees, Flood control, Environmental effects, Sea level, Sea water, Land use, Freshwater, *California, Regional analysis.
Identifiers: *Santa Clara County (Calif.), Baylands, San Francisco Bay.

The purpose was to develop information that would assist in deciding whether the Santa Clara Flood Control and Water District should expand its responsibilities to include protection of Baylands from salt water flooding and how this might be accomplished. Large portions of the Baylands study area are subject to salt water flooding, and in some instances freshwater flooding also. Substantial land subsidence has occurred previously, and is expected in the future. Flooding has become a problem of increasing concern because intensive utility, military, industrial and residential activities have located in portions of the low-lying Baylands. Much of the original tidal grasslands and floodplains have disappeared, modified first to stock pasturage and hay farms, then to truck gardens and orchards, and most recently to more urban uses ringed by freeways. Existing levees of mixed earthwork were constructed primarily to enclose salt ponds, and are located inboard and outboard of the ponds, bounding some 7,600 acres of land and 8,300 acres of wetlands respectively. Agencies with planning and regulatory powers over the study area include the San Francisco Bay Conservation and Development Commission, the Army Corps of Engineers, and the Planning Policy Committee of Santa Clara County. Three alternative plans are considered, including a no action possibility, a system of inboard levees, and a system of outboard levees. The costs for each are noted. Recommendations or conclusions are not included, relevant maps and photos are included. (Edwards-North Carolina)
W73-15020

AN INVENTORY AND ANALYSIS OF EXISTING STORM DRAINAGE SYSTEMS IN THE TOLEDO REGIONAL AREA.
Lucas County Office of the Engineer, Toledo, Ohio.

Available from the National Technical Information Service, Springfield, Va. 22151. Prepared for the Toledo Regional Area Plan for Action, September, 1969. 90 p, 3 fig, 4 plates, 9 ref, 1 append. HUD-Ohio P-47.

Descriptors: *Urban runoff, *Drainage systems, *Government finance, *Floods, *Ohio, Combined Sewers, Open channel flow, Mapping, Urbanization, Storm runoff, Regional analysis.
Identifiers: *Toledo (Ohio).

Flat terrain and broad interstream areas means that the Toledo Regional Area has practically no natural drainage. Urbanization has aggravated this problem by increasing flood water levels and reducing channel capacities. The information presented provides the basis for solving immediate drainage problems, guiding new development to those areas amenable to good drainage, and planning for future drainage. Subject areas include: planning and financing storm drainage facilities, general standards for storm drainage systems, mapping of watershed areas, computation of storm water runoff and water surface elevations. The inadequacy of combined sewers during times of flood is pointed out. A master plan is clearly needed for coordinated future action. A tabulation of existing conditions of the major storm drainage outlets appears in the appendix. (Hoffman-North Carolina)

PREDICTION OF RESERVOIR FILLING FOR STREAMS SUBJECT TO ERRATIC FLOODS,
Centrais Electricas de Sao Paulo (Brazil). Div. of Hydrology.
F. de Gennaro Castro.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, 213-217, 1973. 3 fig.

Descriptors: *Reservoir design, *Streamflow forecasting, Statistical methods, Probability, Water yield, Flood forecasting, Model studies.

A technique to predict reservoir filling in a predesign stage, particularly under erratic flood conditions utilizes the differential mass diagram in an inverse relationship of that ordinarily considered for regulation studies. The set of results, after simple statistical treatment, is plotted in one graph that shows the probability of carrying on the operation under two combined conditions: (a) one particular month as the month chosen to start with the reservoir filling; and (b) a given period as the length of time required to fill the reservoir. Descriptors: *Reservoir operation, *Reservoir yield, *Electric power, *Flood control, Systems analysis, Mathematical models, Flood recurrence interval, Flood frequency, Mexico.
Identifiers: *Mexico City (Mexico).

Systems analysis techniques were applied to the operation of a 716 MW hydroelectric plant in Mexico City served by a reservoir with flood control as a second purpose. Also, the models developed were applied to a multireservoir, multipurpose water resources system. The historical annual maximum floods were synthesized using a modified Gumbel frequency analysis in order to generate hydrographs with different return periods. These return periods, associated with a particular operating horizon of the reservoir produce a simple chart which explicitly shows the flooding risk associated to a given maximum operation level. FLOOD CONTROL POLICIES DEVELOPED BY SIMULATION,
Karlsruhe Univ. (West Germany). Institut fuer Wasserbau III.
E. J. Plate, and G. A. Schultz.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 246-258, 1973. 2 fig, 7 ref.

Descriptors: *Flood control, *Reservoir operation, *Simulation analysis, Optimization, Systems analysis, Flood protection.
Identifiers: *Germany.

In the densely populated Federal Republic of Germany, complete flood control is in most cases not attainable due to prohibitively high costs of land or of resettling. Consequently, flood retention space is the limiting factor in flood control planning. Optimal utilization of the available space requires a policy of releases from reservoirs which become more complex the more reservoirs are in the system. The only promising approach to the problem of obtaining optimal operating rules for a system of reservoirs lies in the application of simulation techniques. A general procedure is given for solving this problem. From an ideal forecast the input event is predicted for the duration of the storm at the beginning of the storm. It should be known as function of space and time. With the input thus determined, the optimum release decisions must be calculated for each reservoir of the system and for each time interval. (Knapp-USGS)

FLOOD CONTROL PLANNING WITH INADEQUATE HYDROLOGIC DATA,
Malyiya Regional Engineering Coll., Jaipur (India). Dept. of Civil Engineering.
R. D. Verma, and R. M. Advani.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 259-268, 1973. 16 ref.

Descriptors: *Planning, *Flood control, *Flood frequency, *Design flood, Statistical methods, Probability, Data collections, Hydrologic data, Flood forecasting.
Identifiers: *Probable maximum flood, *India.

Flood-control planning requires determination and evaluation of all measures which are technically sound. Economics of the alternative flood control measures is a key to planning. Benefits and cost of flood-control projects depend upon the intensity and frequency of discharge for which the flood protection is provided. Flood-control planning with inadequate hydrologic data requires decision under uncertainty. It should be possible, even in the absence of adequate hydrologic data, to use the Gumbel's first asymptotic frequency distribution to calculate flood frequencies if one can determine the parameters of this distribution. The parameters can be determined if the intensities and return periods of minimum and maximum discharges of yearly floods can be estimated by making use of the meteorological records and the physiographic characteristics of the drainage basins. Also, it should be possible to estimate the probable minimum flood using rainfall and catchment data. If its estimation is not possible or is not reliable due to uncertain conditions and if the flood affected region does not regularly get flooded, its value also could be assumed to be equal to zero without causing much error. ANALYSIS OF RISKS AND UNCERTAINTIES IN FLOOD CONTROL,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
V. Yevjevich.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 363-374, 1973. 4 fig, 4 ref. NSF Grant GK-31512X.

Descriptors: *Flood control, *Risks, *Floods, Statistics, Statistical methods, Decision making, Economics, Optimization, Probability, Damages.

Some basic aspects of floods are reviewed with insights into possible avenues of improving the flood control decision process. A definition of basic risk, all types of uncertainties, and their combined total risk, is proposed. Flood damage functions as the basis for economic analysis of flood control and flood plain zoning are subject to large errors and represent a limiting factor on the reliability of decisions. A set of economic damage variables should be related to a set of flood characteristics, all random variables. Several new avenues are outlined for an overall decrease of risk by decreasing uncertainties in the estimation of flood characteristics. A false sense of security is often generated by constructing flood control works. Taking uncertainties into account by economic optimization is often a subjective approach. (Knapp-USGS)

GILLHAM LAKE, COSSATOT RIVER, ARKANSAS, APPENDIX IV, APPENDIX V, APPENDIX VI (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Tulsa, Okla.

Descriptors: *Arkansas, *River systems, *Dams, *Environmental effects, Ecology, Legal aspects, Judicial decisions, Balance of nature, Habitats, Aquatic environment, Dam construction, Wildlife conservation, Flood protection.
Identifiers: *Environmental Impact Statements, *Injunctive relief, *National Environmental Policy Act, Standing (Legal).

This portion of a final environmental impact statement (EIS) contains primarily a transcript of court proceeding in the suit by the Environmental Defense Fund, Inc. and others to halt the construction of the Gillham Dam Project on the Cossatot River in Arkansas. The plaintiffs alleged that the defendants, the Corps of Engineers, were violating the National Environmental Policy Act (NEPA) by failing to prepare an environmental impact study required by the Act. The Corps of Engineers based their defense of the fact that the project in question had received Congressional approval in 1958, some eleven years before NEPA was passed. This, the defendants maintained, precluded the project from the necessity of compliance with NEPA as the Act was not intended to be applied retroactively. The court ultimately determined that NEPA must be complied with. Thus, in spite of the fact that the project was some 63% completed, it has to be halted pending the results of the detailed environmental impact study required by NEPA. Also included is a bibliography of literature cited in the text of the EIS and qualifications of the interdisciplinary personnel who

prepared the EIS. (See also W73-15137) (McKnight-Florida)

A COMPARATIVE VEGETATIONAL STUDY OF TWO NORTH-FACING SLOPES AT ROCK ISLAND STATE PARK, ROCK ISLAND, TENNESSEE,
J. Wooden, and D. Caplenor.
J Tenn Acad Sci. Vol 47, No 4, p 146-151. 1972. Illus.
Identifiers: Adiantum-Capillus-Veneris, Equisetum-Arvense, Ordination, Seepage, Slopes, *Tennessee (Rock Island), Trees, *Vegetation, *State parks.

Two plant communities on north-facing slopes adjoining the Caney Fork River below the Great Falls Dam in Warren County, Tennessee, were sampled using standard nested quadrats. The substrates of the 2 communities differed in that the one nearest the dam had continuous seepage through the underlying bluff from the impounded river above. There was considerable difference in the composition of the communities. Analysis by ordination and by simple coefficient of similarity indicated that the community without seepage was a rather typical mixed mesophytic community (sensu Braun). The tree layer of the community with seepage was found to be strongly influenced by a previous disturbance and was, therefore, judged not to be, at present, representative of the result of the effect of the seepage. Certain herbaceous plants in the seepage area (Adiantum Capillus-Veneris L. and Equisetum arvense L.) did indicate an effect of seepage.--Copyright 1973, Biological Abstracts, Inc.

RIRIE DAM AND LAKE, WILLOW CREEK, IDAHO (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Walla Walla, Wash.

Available from the National Technical Information Service as EIS-ID-73-0276-F, $8.25 in paper copy, $1.45 in microfiche. October 6, 1972. III p, 8 pate, 7 photo, 3 tab.

Descriptors: *Idaho, *Environmental effects, *Flood control, *Dams, Recreation, Wildlife habitat, Irrigation, Agriculture, Water quality standards, Water quality control, Flood prevention, Water conservation, Rockfill dams, Water storage, Federal project policy, Project purposes, Federal government.
Identifiers: *Environmental Impact Statements.

The project site is located in the Willow Creek drainage in Bonneville County, Idaho and consists of the construction of a 251-foot high rockfill dam which will create a lake of 1,560 acres maximum size. Also included is a 7.8 mile long floodway channel. The major purpose of the project will be flood control with some benefits also accruing to recreation and irrigation. Total land requirements for the project will be 6,815 acres. Major impacts of the project will include the conversion of 12 miles of natural streambed to a fluctuating lake, reduction of flooding in the populated downstream areas, a change in landscape character, and loss of waterfowl and deer habitat. The project will cause the loss of about 10 percent of the total length of the natural Willow Creek channel. There will also be an interim loss of wildlife as well as adverse water quality effects. Alternatives include flood plain management, structural alternatives, a dam without a floodway channel, other damsites, and alternate floodway channel routes. The comments of interested governmental agencies are included. (Mockler-Florida)

BRIEFING--MISSISSIPPI RIVER.

Hearing--Comm. on Public Works, U.S. House of Representatives, 93d Cong, 1st Sess, April 1973. 43 p, 13 map, 39 photo, 2 tab.

Descriptors: *Water levels, Water resources development, Planning, Floods, Forecasting, Discharge measurement, Data collection, *Mississippi River.
Identifiers: Levies, Spillways.

Testimony was taken and material received for the record detailing the situation in the lower Mississippi Valley as a result of the heavy flooding early in the year. Testimony was given to the effect that the Mississippi River and tributary flood control plan has substantially reduced damage and kept it minimal. Federal levees held back the flood waters whereas private ones failed, a situation attributed to a lack of engineering and proper construction among other factors. Floodways and spillways were opened and appeared to operate as designed. Many photographs and diagrams are included. (Wadley-Florida)

A NATIONAL WATER GRID FOR INDIA.
Economic Commission for Asia and the Far East (UN), New York.

Water Resources Journal, United Nations Economic Commission for Asia and the Far East (ECAFE), p 1-17, December 1972. 5 fig.

Descriptors: *Water resources development, *Canals, *Inter-basin transfers, Water conveyance, Water supply, Flood control, Irrigation water, Water transfer, Planning.
Identifiers: *India.

India is studying proposals for the construction of a national water grid, of which one of the important components would be the Ganga-Cauvery Link Canal. The purpose of this project is to supply surplus and floodwater from the Ganga River during the monsoon months to regions in western, central, and southern India which are exposed to an unsatisfactory water regime and frequent droughts. Water will be drawn from the Ganga near Patna and lifted by means of large-scale pumping to a point near the divide between the basins of the Ganga and Narmada from where 10 to 20 million acre-feet can be distributed by gravity canal or by natural river courses either to the west or to the south. Surplus water of the Narmada and Godavari Rivers which is at present flowing to waste in the sea during the flood season will be used for augmenting supplies to the grid. The Ganga-Cauvery Link Canal, with a length of 1,500 to 2,000 mi would provide an important interconnection between all major rivers of central and southern India, constituting a backbone for an integrated grid system controlling water supply, irrigation, and navigation in the peninsula. 4B. Groundwater Management

THE EFFECTS OF DIMINISHED GROUNDWATER SUPPLIES ON SELECTED NEW HAMPSHIRE INDUSTRIES,
New Hampshire Univ., Durham. Dept. of Agricultural and Food Economics.
R. H. Forste.
Available from the National Technical Information Service as PB-223 803, $9.75 in paper copy, $1.45 in microfiche. PhD Dissertation, 1973. 140 p, 17 fig, 28 tab, 57 ref. OWRR A-028-NH (1). 14-31-0001-3529.

Descriptors: *Water management (Applied), *Water utilization, *Groundwater, *Reasonable use, Competing uses, Legal aspects, Water rights, Resource allocation, Economics, Water law, *New Hampshire, Institutional constraints, Withdrawal, *Water allocation (Policy).

Increasing withdrawals of groundwater for industrial and residential uses in New Hampshire present allocation problems involving legal and economic equity. Legal issues have been based on the rule of reasonable use. To deal with groundwater allocation, the economic damages/losses resulting from diminished groundwater should be considered and estimated. The New Hampshire courts haven't had these estimates, or a methodology for determining them. The objectives of this study were to (1) estimate the costs incurred by industrial groundwater users if supply constraints are imposed; (2) outline a methodological framework to guide decisions on resource allocations; (3) assess the impact on selected industrial groundwater users in the short-run and project long-run adjustments under supply constraints. Four firms were selected for analysis. Cost struc-

ture of the firms was related to their industrial processes. The groundwater law and equity were examined. Several implications may be drawn from the findings: (1) research on the availability of groundwater supplies is necessary; (2) ownership of groundwater rests in the public and should be utilized accordingly; (3) the premise of societal ownership implies regulation and management of the resource by the State; (4) regulatory commissions and courts should have the economic implications of alternatives available when faced with a groundwater dispute. The partial budgeting simulations developed provide an example of one technique that would be feasible, useful and expeditious in this context.

UTILISATION OF DISUSED COAL MINES AS WATER STORAGE RESERVOIRS,
Teesside Polytechnic, Middlesbrough (England). Dept. of Civil Engineering.
T. Cairney.
Journal of Hydrology, Vol 19, No 3, p 251-258, July 1973. 3 fig, 5 ref.

Descriptors: *Water storage, *Coal mines, *Underground storage, Mine water, Reservoir yield, Reservoirs, *Reservoir storage, Coal mines.
Identifiers: *England.

The potential of underground storage of water in disused coal workings is discussed. Where conditions are suitable, mine workings offer large yields at low cost. In rural areas of Britain, minewaters are often taken into the public supply. However, individual mines seldom yield more than 1 million gallons per day, since the sandstones and shales associated with coal seams are usually of low permeability. However, the water yield of an entire coalfield can be surprisingly high. The North-Eastern Coalfield in the counties of Northumberland and Durham produced some 80 million gallons per day until recent years. On economic grounds, direct pumping is usually not feasible. However, very large underground storage volumes often exist in mines and these offer a solution to the water supply-land conservation problem. (Knapp-USGS)

Identifiers: *USSR.

Fundamental principles for a regional estimate of natural groundwater resources and safe yield are examined. Patterns of groundwater occurrence, depending on different natural factors, are determined from mapping of natural groundwater resources in the USSR, and role of groundwater and base flow in total water resources and water balance of the country is described. The ratio of groundwater to surface waters is tabulated for individual hydrogeological regions of the USSR, and basic problems in the study of groundwater resources are discussed. (Josefson-USGS)

WATER QUALITY AND MINERAL SOLUBILITIES IN SURFACE AND GROUND WATER; OAK OPENINGS COMMUNITY, LUCAS CO., OHIO,
Toledo Univ., Ohio. Dept. of Geology.
N. Valkenburg.
Available from the National Technical Information Service as PB-224 014, $7.25 in paper copy, $1.45 in microfiche. M. S. Thesis, 1973. 90 p. OWRR C-3082 (No. 3682) (1). OWRR 14-31-0001-3682.

Descriptors: *Water quality, *Groundwater movement, Groundwater, Surface waters, Water chemistry, *Ohio, Aquifers, Trace elements, Lead, Zinc, Cadmium, Dissolved solids, Sodium chloride, Sands, *Urban renewal, *Mineral water.
Identifiers: *Toledo (Ohio).

Oak Openings Community is a 4,587 acre County Renewal area situated on a surficial sand aquifer. Ground water samples were extracted from near the bottom of the aquifer through drive points at four sites. At five additional sites ground water samples were extracted through well screens installed across the water table. Surface water samples were collected from drainage ditches at eight sites. Samples were collected from these surface water and groundwater sites seven times between May 4, 1972, and March 9, 1973. Each sample was analyzed for calcium, magnesium, sodium, potassium, chloride, nitrate, bicarbonate, lead, zinc, cadmium, iron, specific conductance, pH, total dissolved solids, and hardness. The maximum total dissolved solids was 642 parts per million, and only iron content exceeded U. S. Public Health Service and Ohio Department of Health recommendations. All water was the calcium-bicarbonate type, and surface water was more highly mineralized than ground water. Mineral equilibria calculations using analyzed values of dissolved species suggest that both ground water and surface water are in near equilibrium with aquifer minerals except for sodium and chloride, which imply additional halite that is not known to be a natural aquifer mineral.

APPRAISAL OF THE WATER RESOURCES OF CHARLOTTE COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
H. Sutcliffee, Jr.
Open-file report 73010, 1973. 61 p, 18 fig, 13 tab, 23 ref.

Descriptors: *Water resources development, *Surface waters, *Groundwater, *Urbanization, *Florida, Water quality, Projections, Water demand, Hydrologic data, Aquifer characteristics, Water wells, Water yield, Water analysis, Chemical analysis, Water supply, Water utilization, Streamflow, Reservoirs, Agriculture, Water table aquifers, Water levels, Salinity, Desalination.
Identifiers: *Charlotte County (Fla).

The coastal area of Charlotte County, in west-central Florida, is undergoing rapid urbanization and is experiencing major problems in obtaining sufficient water of suitable quality to meet public-supply requirements. The relatively flat county is drained by two major streams, the Myakka and Peace Rivers, and many small streams and canals. Neither of the major streams is used for water supply. Although the average rainfall is 54 inches per year, the low-flow characteristics are such that little or no flow will occur in most streams for as much as 30 consecutive days on the average once every 20 years. The chemical quality of water in most of the streams and canals is suitable for use by public water supplies. However, most favorable reservoir sites are already in use. Large water supplies for Charlotte County will be obtained in the future chiefly from: (1) the water-table aquifer in the southeastern part where permeable shell beds can yield as much as 600 gpm of potable water; (2) zones that have not been contaminated by saline water; (3) desalted groundwater; and (4) water imported from outside the county. (Woodard-USGS)
W73-14996

USE OF GROUND WATER FOR IRRIGATION IN SEWARD COUNTY, NEBRASKA IN 1971,
Geological Survey, Lincoln, Nebr.
E. K. Steele, Jr.
Open-file Report 7308, August 1973. 28 p, 13 fig, 2 tab, 8 ref.

Descriptors: *Irrigation wells, *Groundwater, *Withdrawal, *Irrigation, *Nebraska, Hydrologic data, Drainage, Topography, Soils, Precipitation (Atmospheric), Pumping, Water level fluctuations, Groundwater movement, Groundwater recharge, Crop production.
Identifiers: *Seward County (Neb).

Use of groundwater for irrigation in Seward County, Nebraska, west of the Big Blue River increased tremendously from 1945 to 1971. During that period, the number of irrigation wells increased from 5 to 614. Groundwater withdrawals prior to 1971 are estimated to have reduced groundwater storage by about 270,000 acre-feet, and withdrawals during 1971 continued to reduce storage. The values for changes in storage were computed from weighted-average net differences in groundwater levels. In 1971, average pumpage from the 32 wells for which well yield and hours of pumping were recorded indicates that pumpage from all wells totaled about 83,000 acre-feet. (Woodard-USGS)
W73-14997

WATER RESOURCES OF THE DELMARVA PENINSULA, A SUMMARY REPORT TO THE CONGRESS,
Geological Survey, Parkville, Md.
E. M. Cushing, I. H. Kantrowitz, and K. R. Taylor.
House Document No 93-68, 93rd Congress, 1st Session, Message from President of United States Transmitting Summary Report on Water Resources of Delmarva Peninsula: U.S. Government Printing Office, Washington, 1973. 59 p, 43 fig, 6 tab, 3 ref.

Descriptors: *Water resources, *Delaware, *Maryland, *Virginia, Surface waters, Groundwater, Water yield, Water quality, Water utilization, Water resources development, Projections, Hydrologic data, Precipitation (Atmospheric), Streamflow, Runoff, Aquifer characteristics, Chemical analysis, Estuaries, Salinity, Data collections, Forecasting, Evaluation.
Identifiers: *Delmarva Peninsula.

The Delmarva Peninsula comprises about 6,5000 square miles on the Atlantic Coastal Plain and includes parts of Delaware, Maryland, and Virginia. The peninsula is underlain by unconsolidated (Coastal Plain) sediments that range in thickness from a featheredge at the Fall Line (the northern boundary of the peninsula) to as much as 8,000 feet along parts of the Atlantic coast. Many of the streams, including some of the smaller ones (less than 25 square miles), have flows sufficient to provide water supplies greater than 1 mgd during a low-flow period having a recurrence interval of 10 years. Streamflow is generally low in dissolved solids and chemically suitable for most uses except in the downstream reaches of those streams subject to tidal invasion of saline water. Annual use of water on the peninsula in 1970 was about 137 mgd, of which about 14 mgd was withdrawn from streams for irrigation supplies, and the remainder, 123 mgd, was withdrawn from the aquifers. About 75% of the groundwater supply was from the Quaternary aquifer and the water-table parts of the older aquifers. The amount of freshwater that can be developed perennially on the peninsula is estimated to be at least 1,5000 mgd. This amount is about six times the estimated use of water on the peninsula by the year 2010. (Woodard-USGS

HYDROLOGIC DATA FOR 1971, BROWARD COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
H. W. Bearden.
Geological Survey open-file report 73016, 1973. 87 p, 42 fig, 4 tab, 14 ref.

Descriptors: *Water resources, *Hydrologic aspects, *Hydrologic data, *Water quality, *Florida, Surface waters, Canals, Groundwater, Water wells, Water yield, Aquifer characteristics, Rainfall, Runoff, Groundwater recharge, Water analysis, Chemical analysis, Salinity, Hydrographs, Data collections.
Identifiers: *Broward County (Fla).

The general hydrologic conditions in Broward County for the 1971 water year are portrayed by graphically comparing long periods of record from rainfall, groundwater, surface-water, and water-quality stations with records from these stations for the 1971 water year. Water-level fluctuations were monitored in 79 wells. A continuous record of stage and discharge was obtained from 7 stream-gaging stations in canals. The record for one station in Dade County, Snake Creek Canal at S-29, is also discussed. Tidal fluctuations in the Intracoastal Waterway are recorded at 4 stations. Samples for analysis of natural constituents, metals, nutrients, pesticides, and bacteria are collected quarterly at 25 sites. Field determinations of DO, pH, temperature, specific conductance, and alkalinity are made at 4-hour intervals during a 24-hour period each quarter at the 25 sites. Samples for chloride analysis are collected monthly at salinity control structures and at selected sites in the tidal canals. Conductivity recorders are maintained in three canals near major well fields. The average annual rainfall in Broward County, based on 28 calendar years of record, is 59.10 inches. Rainfall averaged 35.86 inches during the 1971 water year. (Woodard-USGS)

4C. Effects on Water of Man's Non-Water Activities

VARIATION OF URBAN RUNOFF QUALITY WITH DURATION AND INTENSITY OF STORMS--PHASE II,
Texas Tech Univ., Lubbock. Water Resources Center.
D. M. Wells, J. F. Anderson, R. M. Sweazy, and B. J. Claborn.
Available from the National Technical Information Service as PB-223 930, $3.75 in paper copy, $1.45 in microfiche. Project Completion Report (WRC-73-2), August 1973. 87 p, 14 fig, 33 tab, 17 ref. OWRR B-104-TEX (1). 14-31-0001-3654.

Descriptors: *Water quality, *Urban runoff, *Water analysis, *Environmental effects, *Texas, Urbanization, Storm runoff, Surface runoff, Asphalt, Concretes, Chemical analysis, Data collections, Correlation analysis, Water pollution sources, Water treatment.
Identifiers: *Lubbock (Tex).

The variation of urban runoff quality was investigated with the duration and intensity of storms. The data obtained were analyzed using stepwise linear regression to determine significant trends in how storm characteristics and antecedent conditions affect runoff quality. The project utilized a 223-acre watershed location within south-central Lubbock, Texas. Samples were analyzed for total and fecal coliform, chemical oxygen demand, biochemical oxygen demand, total residue, volatile residue, total suspended solids, volatile suspended solids, pH, alkalinity, nitrate nitrogen, and orthophosphate. All of the runoff from the basin is routed directly into the concrete channel on the west side of K. N. Clapp Park in which the Parshall flume, automatic rain gage, and sampler were located. Approximately 5.6 miles of streets and 3.1 miles of alleys carry runoff during precipitation. The streets are paved with asphaltic concrete with concrete curbs and gutters. The average concentration of BOD in urban stormwater runoff was approximately one-third the concentration expected to be found in raw domestic sewage and approximately 10 times the average concentration of the secondary effluent from Lubbock, Texas. MODEL FOR CALCULATING FLOODS IN URBANIZED WATERSHEDS,
Technische Hochschule, Brunswick (West Germany).
U. Maniak.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 429-435, 1973. 4 fig, 3 ref.

Descriptors: *Flood routing, *Urban hydrology, *Urbanization, Mathematical models, Rainfall-runoff relationships, Storm runoff, Urban runoff, Storm water.
Identifiers: *Germany.

Streamflow records in areas subject to urbanization are difficult to interpret from a statistical point of view because of short length, sparse

gages, and nonhomogeneity. For this reason it is usually necessary to study the long term hydrologic effects of urbanization by simulation using rainfall-runoff models. Modeling techniques must be used for developing optimal designs for hydraulic structures. Input data required for simulation of urban watersheds include distribution of precipitation amount, duration, and frequency as well as areal variations of rainfall. For the southern and northwestern parts of Germany, floods are often caused by storms having stripes of heavy precipitation embedded in zones of general rainfall. For modeling purposes, the watersheds are divided into subunits ranging in size from 0.5 to 3 sq km depending upon the characteristics of the watershed and the degree of urbanization. Surface roughness and surface slope are estimated for the subareas. Surface runoff and interflow are computed separately. The surface runoff is determined by deducting infiltration, depression storage, and interception from the precipitation. Interflow is estimated using an experimental parameter depending upon the soil moisture storage capacity. The surface runoff and interflow are combined and routed downstream using well known storage equations. (Knapp-USGS)

PREDICTIVE STUDY ON URBANIZING EFFECT OF DRAINAGE BASIN ON FLOOD RUNOFF,
Kyoto Univ. (Japan). Disaster Prevention Research Inst.
M. Kodoya.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 436-449, 1973. 8 fig, 4 ref.

Descriptors: *Urban hydrology, *Rainfall-runoff relationships, *Infiltration, Urbanization, Floods, Storm runoff, Urban runoff, Storm water, Peak discharge.
Identifiers: *Kinematic waves, *Japan.

A study was undertaken in Japan to develop a suitable method for predicting the effect of urbanization on flood runoff. Removing the previous ground surface layer and replacing with pavement causes the decrease of groundwater and interflow components, and pavement and channelizing of the ground surface change the roughness to accelerate and concentrate the overland flow. Three conceptual models are introduced. These are the kinematic wave model for overland flow and/or direct runoff, the interflow model for the flow in porous surface strata, and the recharge capacity model for groundwater runoff. A simple method is also given for estimating the maximum peak runoff. The method is based on the estimation of the concentration time. (Knapp-USGS)

4D. Watershed Protection

DEFORESTATION EFFECTS ON SOIL MOISTURE, STREAMFLOW, AND WATER BALANCE IN THE CENTRAL APPALACHIANS,
Forest Service (USDA), Upper Darby, Pa. Northeastern Forest Experiment Station.
J. H. Patric.
Research Paper NE-259, 1973, 12 p. 3 fig, 8 tab, 39 ref.

Descriptors: *Soil moisture, *Streamflow, *Water balance, *Precipitation (Atmospheric), *Watersheds (Divides), *Forest soils, Soil types, *Clear-cutting, Transpiration, Runoff, Storm runoff, Surface runoff, Leaves, Evaporation, United States, Mountains, Mountain forests, Seasonal, Trees, *Appalachian Mountain Region, *West Virginia.

Soil moisture, precipitation, and streamflow were measured on three watersheds in West Virginia, two deforested and one forested. Water content of barren soil always exceeded that of forest soil throughout the growing season, especially in dry weather. Streamflow increased 10 inches annually on the cleared watersheds, mostly between July and October. Higher soil moisture was accompanied by large instantaneous peak flows during small storms in the growing season. This peak effect was minor in large storms and in all storms during the dormant season. The water balance equation was solved for transpiration with sufficient sensitivity to demonstrate the effects of tree leaf growth. After leaves were fully grown, calculated evaporative losses from the forested watershed exceeded potential rates when unmeasured runoff (leakage) was disregarded. Estimated leakage seemed consistent with observed stream behavior. (Brown-IPC)

VEGETATION CHANGES AS A RESULT OF SOIL RIPPING ON THE RIO PUERCO IN NEW MEXICO,
Forest Service (USDA), Albuquerque, N. Mex. Rocky Mountain Forest and Range Experiment Station.
E. F. Aldon, and G. Garcia.
Journal of Range Management, Vol 25, No 5, p 381-383, September 1972. 2 fig, 1 tab, 6 ref.

Descriptors: *Soil management, *Surface runoff, *Forages, *Vegetation effects, Deep tillage, Infiltration, Watershed management, Erosion control, Semiarid climates, Grasslands, *New Mexico, Southwest U.S.
Identifiers: *Soil ripping, *San Luis watershed (N. Mex).

Soil ripping effectively reduces surface runoff and erosion from semiarid watersheds as well as causing a favorable shift in forage production on the San Luis watersheds. This area is the transition zone between woodland and semidesert grassland with annual precipitation close to 10 in. with average growing season precipitation (May 1-November 1) around 6 in. Investigation was conducted over a period of 15 years revealing the treatment's effectiveness for runoff and erosion control is short lived, but its effect on plants--a favorable shift in forage importance from galleta to alkaki sacaton--has continued for seven years. The trend to revert back to original relationship is indicated, the original relationship taking another 3 to 5 years to reestablish. (Bahre-Ariz.)
W73-15213

INTRODUCED ANIMAL EFFECTS AND EROSION PHENOMENA IN THE NORTHERN UREWERA FORESTS,
Olsen (P. F.) Co. Ltd., Rotorua (New Zealand).
F. P. Wallis, and I. L. James.
N Z J For. Vol 17, No 1, p 21-36. 1972. Illus.
Identifiers: Animals, Beech, Deer, *Erosion control, Forests, *New Zealand (Northern Urewera), Opossum, Rain, Soils, Storms, Streams.

The northern Urewera forests provide major indirect benefits to most of the eastern Bay of Plenty farmlands and towns through control of erosion and water runoff on the steep unstable mountain land that occupies 75% of the Whakatane and Waioeka River catchments. Recent assessments in this forest region show that there has been a depletion of deer preferred species and a depression of advance growth stockings throughout the main forest types. A decline in deer numbers, attributed mainly to recent animal control operations, appears to be effecting an improvement in beech and podocarp-hardwood forest stockings. Where opossum numbers are high, their damage to shrub hardwood forest occupying unstable sites is considered to have increased shallow depth earth movements and stream channel erosion. Major slipping in the region is associated with the high intensity rainstorms, steep slopes and soil physical properties.--Copyright 1973, Biological Abstracts, Inc

05. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification of Pollutants

ALLEVIATION OF LAKE POLLUTION BY UTILIZATION OF AQUATIC PLANTS FOR NUTRITIONAL, MEDICINAL OR INDUSTRIAL PURPOSES,
Minnesota Univ., Minneapolis. Dept. of Pharmacognosy.
E. J. Staba.
Available from the National Technical Information Service as PB-223 963, $3.00 in paper copy, $1.45 in microfiche. Minnesota Water Resources Research Center, Minneapolis, Mimeographed Report, September 1973. 31 p, 1 tab, 7 ref. OWRR A-025-MINN (6).

Descriptors: *Aquatic plants, *Minnesota, Toxicity, Protein, Nutrients, Forage, Carbohydrates, Lakes, Lipids, Organic compounds, Coagulation, Chromatography, Gas chromatography, Inhibitions, Analytical techniques, Methodology.
Identifiers: Hemolysis test, Froth test, Methanolysis, Hydrogenation, Dragendorff positive spots, Flavonols, Tannins, Saponins.

A study was conducted with a reasonable anticipation of finding compounds such as alkaloids, flavonoids, tannins, saponins, steroids and lipids which might be useful in medicine. Examination of chemical constitutents was accomplished on the following plants collected from various lakes in Minnesota: Anacharis canadensis, Calla Polustris, Carex lacustris, Ceratophyllum demersum, Chara vulgaris, Eleocharis smallii, Lemna minor, Myriophyllum exalbescens, Nuphar variegatum, Nymphaea tuberosa, Potamogeton amplifolius, P. natans, P. pectinatus, P. richardson, P. zosteriformis, Sagittaria cuneata, S. latifolia, Sparganium eurycarpum, S. fluctuans, Typha angustifolia, Vallisneria americana, and Zizania aquetica. Thin-layer chromatographic detection studies indicated original extracts did not appear to contain alkaloids. Several plant species demonstrated Dragendorff positive spots. Flavonols were most widely distributed in the plant extracts studies. Tannins, especially the condensed type, were widely distributed in the plants screened. Five species of plants are saponin positive. Beta-sitosterol was tentatively identified as being present in 8 species. The lipid contents of 3 species may be considered for their nutritional value. The toxicity of the aquatic plants in general was found to be relatively low. (Walton-Minnesota)

DETERMINATION OF TRACE QUANTITIES OF ARSENIC IN WASTEWATERS BY CARBON ROD ATOMIC ABSORPTION SPECTROMETRY,
Los Angeles County Sanitation District, Whittier, Calif. San Jose Creek Water Quality Lab.
R. B. Baird, S. Pourian, and S. M. Gabrielian.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 15, p 67-76, 1973. 1 fig, 2 tab, 8 ref.

Descriptors: *Spectrophotometry, *Flame photometry, *Arsenic compounds, Pollutant identification, Trace elements, Water analysis, Chemical analysis.
Identifiers: *Atomic absorption spectrophotometry.

A flameless atomic absorption method is given for the analysis of arsenic in wastewaters. The method employs a carbon rod atomizer. The analysis offers comparable sensitivity to the arsine methods while also demonstrating the ability to recover organic as well as inorganic arsenic from spiked wastewater samples. The absolute detection limits determined experimentally for arsenic standards and wastewaters are 40 and 44 picograms, respectively. This corresponds to a relative detection limit of about 10 micrograms per liter when an 8:1 concentration is used. The sensitivity of the method for wastewaters containing arsenic in a matrix of nitric acid is 60 picograms. (Knapp-USGS)

ENVIRONMENTAL MONITORING HELPS RESOLVE POLLUTION PROBLEMS,
Westinghouse Electric Corp., Raleigh, N.C. Meter Div.
J. J. Paulus.
Westinghouse Engineer, Vol 33, No 5, p 150-155, Sept. 1973. 5 fig, 2 ref.

Descriptors: *Monitoring, *Control systems, *Pollutant identification, *Instrumentation, Air pollution, Water pollution, Sensors, Computers, Data processing, On-site data collection, Data storage and retrieval, Water quality control, Dissolved oxygen, Hydrogen ion concentration, Conductivity, Turbidity, Temperature, Water levels, Flow, Water analysis.

The Adviser Environmental System (AES), described and illustrated, automatically senses, records, and transmits atmospheric and/or aqueous environmental conditions and supplies data in a form ready for computer analysis. The AES comprises sensors, sensor calibration, and support equipment, enclosures and towers, and two parallel data acquisition subsystems, viz., a Report and Historical System (RHS) and an Operational Real-Time System (ORTS). Sensor data from the RHS are collected at the monitoring site and recorded on magnetic tape cartridges which are collected monthly and transferred to computer tape, punched cards, or computer storage. The ORTS permits real-time parameters to be read on-site or from a remote location on command, either at regular preset intervals or as an alarm signal whenever a given pollutant exceeds a preset limit. Among water quality parameter sensors that can be interfaced with the AES are continuous monitors for dissolved oxygen, pH, conductivity, turbidity, temperature, water level, and flow. Future additions to the system are planned to monitor also BOD, COD, TOD (total oxygen demand), TOC (total organic carbon), nitrogen and sulfur compounds, chlorides, chlorine, phosphates, and various other ions. SPECTROPHOTOMETRIC DETERMINATION OF VANADIUM IN SEA WATER,
Hokkaido Univ., Hakodate (Japan). Faculty of Fisheries.
M. Nishimura, K. Matsunaga, T. Kudo, and F. Obara.
Analytica Chimica Acta, Vol 65, No 2, p 466-468, July 1973. 1 fig, 1 tab, 10 ref.

Descriptors: *Sea water, *Water analysis, *Metals, Saline water, Water types, Photometry, Spectrophotometry, Analytical techniques, Chemical analysis, Trace elements, Foreign research, Turbidity.
Identifiers: *Vanadium, Japan.

The method described eliminates the need for preconcentration of sea water samples. It is based on the selective reaction of 4- (2-pyridylazo)resorcinol (PAR) with vanadium in the presence of 1,2-cyclohexanediamine-tetraacetic acide (CyDTA), followed by extraction with chloroform via coupling with tetradecyl-dimethyl-benzylammonium chloride (Zephiramine). Turbidity in the chloroform layer is eliminated, and more complete masking of interfering ions in sea water is achieved by adding potassium cyanide (KCN) with the CyDTA and washing the chloroform layer with NaCl solution. The sensitivity of the spectrophotometric determination was 0.025 microgram vanadium per liter for 0.001 absorbance, with a standard deviation of 8% at the 1 microgram per liter vanadium level and 3% at the 3 microgram level. (Brown-IPC)

A NEUTRON ACTIVATION PROCEDURE FOR THE DETERMINATION OF DISSOLVED SILVER IN SEA WATER,
Liverpool Univ. (England). Dept. of Oceanography.
K. Kawabuchi, and J. P. Riley.
Analytica Chimica Acta, Vol 65, No 2, p 271-277, July 1973. 1 tab, 1 fig, 16 ref.

Descriptors: *Sea water, *Water analysis, *Metals, *Neutron activation analysis, Saline water, Water types, Analytical techniques, Chemical analysis, Separation techniques, Radiochemical analysis, Trace elements, Ion exchange.
Identifiers: *Silver.

In the procedure described, silver (Ag) is preconcentrated by anion exchange, the concentrate is subjected to bombardment with thermal neutrons, and Ag-110m is separated from other radionuclides by a conventional radiochemical separation scheme. At a silver level of 40 ng/liter, the method gave a coefficient of variation of plus or minus 10%. (Brown-IPC)
W73-14951

THE DETERMINATION OF CHLORINATED ALIPHATIC HYDROCARBONS IN AIR, NATURAL WATERS, MARINE ORGANISMS, AND SEDIMENTS,
Liverpool Univ. (England). Dept. of Oceanography.
A. J. Murray, and J. P. Riley.
Analytica Chimica Acta, Vol 65, No 2, p 261-270, July 1973. 6 fig, 3 tab, 2 ref.

Descriptors: *Water analysis, *Pollutants, *Organic compounds, *Chlorinated hydro-carbon pesticides, Air, Natural streams, Running waters, Bodies of water, Sediments, Moluscs, Aquatic animals, Aquatic life, Chemical analysis, Halogenated pesticides, Air environments, Analytical techniques, Gas chromatography, Chromatography, *Pollutant identification.

In the described procedure for the nearly quantitative extraction and determination of chlorinated aliphatic hydrocarbons, the C1 compounds are stripped from water samples by bubbling with nitrogen, from aquatic organisms or sediments by heating in a nitrogen current, and from air samples by passage through activated carbon traps and subsequent desorption by heating in nitrogen. In either case, the halogen compounds are trapped in copper columns packed with Chromosorb coated with a silicone oil, and cooled to -78C. The columns are swept out with argon into a gas chromatographic column, and the chromatogram peaks are ascertained with an electron-capture detector. Among C1 compounds thus found in air and water samples were carbon tetrachloride, chloroform, trichloroethylene, and perchloroethylene. Their concentration in waters sampled away from industrial areas ranged from 0.5 to 18.5 ng/liter, in air samples from 2.5 to 6.5 ng/cu m. In samples from urban areas, the concentrations were one to two orders of magnitude higher. Significant amounts of these plus other unidentified C1 compounds were also observed in mollusc tissues and estuarine sediments. Minor amounts of short-chain halogen compounds, such as methyl chloride and dichlorodifluoromethane, were also detected, especially in air samples. (Brown-IPC)

ANALYSIS OF HIGH-PURITY WATER BY FLAMELESS ATOMIC ABSORPTION SPECTROSCOPY. I. THE USE OF AN AUTOMATED SAMPLING SYSTEM,
European Atomic Energy Community, Ispra (Italy). Joint Nuclear Research Center.
C. J. Pickford, and G. Rossi.
The Analyst (Journal of the Society for Analytical Chemistry), Vol 97, p 647-652, Aug 1972. 2 fig, 2 tab, 8 ref.

Descriptors: *Cooling water, Spectroscopy, *Analytical techniques, *Sampling, *Water analysis, *Trace elements, Chemical analysis, Nuclear powerplants, Powerplants, Electric powerplants, Corrosion, Water types, Automation, Cobalt, Copper, Chromium, Iron, Manganese, Nickel.
Identifiers: *Atomic absorption spectroscopy.

Corrosion studies on water-cooled nuclear power plants were hitherto hindered by lack of a sufficiently sensitive and precise method for determining trace metals in parts-per-billion amounts in high-temperature water circuits. Manual sampling and sample injection methods for graphite-tube analyses and subsequent atomic absorption spec-

trometry involved contamination hazards and other problems. An apparatus for fully automatic stream sampling and multiple aliquot sample injection is described, which permits, e.g., 10-100 microgram/liter traces of Co, Cr, Cu, Fe, Mn, and Ni to be determined with a standard deviation of 0.6 to 2.4% on 10 to 17 replicate samples. (See also W73-14956) (Brown-IPC)

ANALYSIS OF HIGH-PURITY WATER BY FLAMELESS ATOMIC ABSORPTION SPECTROSCOPY. II. SIGNAL INTEGRATION WITH A NON-RESONANCE LINE CORRECTION SYSTEM FOR SPURIOUS ABSORPTION PHENOMENA,
European Atomic Energy Community, Ispra (Italy). Joint Nuclear Research Center.
C. J. Pickford, and G. Rossi.
The Analyst (Journal of the Society for Analytical Chemistry), Vol 98, No 1166, p 329-334, May 1973. 4 fig, 1 tab, 15 ref.

Descriptors: Spectroscopy, *Analytical techniques, *Water analysis, *Trace elements, *Cooling water, Nuclear power plants, Powerplants, Electric powerplants, Corrosion, Water types, Automation, Chemical analysis, Cobalt, Copper, Chromium, Iron, Manganese, Nickel.
Identifiers: *Atomic absorption spectroscopy.

The precision of graphite-tube flameless atomic-absorption spectroscopy, particularly at low concentrations (parts-per-billion levels) of metal traces, was greatly improved by using a non-resonance line correction system and integration of the absorption signal. The precision of a system comprising a polychromator plus multichannel integrator and automatic sample injector (described in Part I) was evaluated at high and low absorbances. Its ability to compensate for spurious absorption and variable volatility effects was also examined. Some variations in signal intensity caused by changes in volatility of water samples could be eliminated. The compensation for spurious absorption phenomena was satisfactory up to 95% absorption, provided that the reference line was close to that of the main element. The system was suitable as a first approach to fully automatic simultaneous determinations of several trace elements. A more appropriate spectrophotometer and a more sophisticated exit slit assembly would improve the system's flexibility. (See also W73-14955) (Brown-IPC)

Identifiers: *Error sources, *C-14, Enrichment, Errors, Excretion, Dissolved organic matter, Particulate organic matter, Polysaccharides.

Since large amounts of carbon assimilated during photosynthesis have been shown to be excreted by phytoplankters, it is believed that the release of C-14-tagged compounds could lead to a considerable underestimation of primary productivity using the Steemann-Nielsen (1952) C-14 technique. Using the above as a basis, primary productivity has been estimated for the particulate and dissolved organic fraction in the eutrophic Rhine River using the liquid scintillation method of Anderson and Zeutschel (1970). Other sources of error were also investigated: (1) labeled polysaccharides and other organic compounds of the gelatinous material in which phytoplankton colonies are embedded and (2) the high content of dissolved silica in C-14 ampoules which results in an overestimation. Results of preliminary experiments using seawater from the edge of the Rhine River plume show that (1) productivity may be enhanced by the level of silica enrichment taking place when the contents of normal C-14 ampoules are added to small samples; (2) overestimation will probably be minimized if short incubation periods are used; and (3) the activity of filters and filtrates should be measured when dealing with dominant phytoplankton species which secrete gelatinous sheaths. SIMPLE APPARATUS FOR CONDUCTING ACUTE TOXICITY BIOASSAYS UNDER FIELD CONDITIONS,
Department of the Environment, Winnipeg (Manitoba). Fisheries Service
M. R. Falk.
Water Research, Vol 7, No 6, p 821-822, June 1973. 1 fig.

Descriptors: *Bioassay, *Mechanical equipment, *On-site tests, *Costs.
Identifiers: *Cages.

Cages 61 X 30.5 X 30.5 cm were constructed from aluminum angle frames for use in field bioassays. Within each cage a 0.64 cm braided nylon mesh bag with an opening of 100 sq cm was suspended and attached along the top. A plastic bag 46 X 96 cm was placed in each mesh bag. The apparatus was tested by lashing six of the cages together and anchoring them in 20 cm of water. Fish from the area were placed in the bags which were lightly aerated. Results were comparable to those obtained in laboratory tests. However, the portable apparatus was much cheaper to set up and saved the cost of shipping effluents. (Little-Battelle)

Phycologia, Vol 12, Nos 1/2, p 1-9, June 1973. 19 fig, 3 tab, 31 ref.

Descriptors: *Electron microscopy, *Systematics, Diatoms, Chrysophyta.
Identifiers: *Chaetoceros septentrionale, *Ultrastructure.

The ultrastructural detail and a schematic reconstruction of the silica shell of Chaetoceros septentrionale Oestrup are presented. The material for this study was derived from cultured material from four sources in Pacific and Atlantic coastal waters. A significant finding is the participation of the valvar costae in the formation of the setae. Three types of girdle bands are described. The first girdle band is equipped with horns that project upward into the basal parts of the setae. These findings are compared with previous descriptions of Chaetoceros septentrionale and other members of the genus Chaetoceros, particularly in reference to the differentiation of girdle bands and intercalary bands. (Little-Battelle)

A RAPID METHOD FOR CLEARING DIATOMS FROM TAXONOMIC AND ECOLOGICAL STUDIES,
Oklahoma Univ., Willis. Biological Station.
G. A. Zoto, D. O. Dillon, and H. E. Schlichting, Jr.
Phycologia, Vol 12, Nos 1/2, p 69-70, June 1973. 10 ref.

Descriptors: *Systematics, Ecology, *Diatoms, *Methodology, *Cytological studies, Pollutant identification, Chrysophyta.
Identifiers: *Sample preparation, Rhizosolenia, Attheya, Chaetoceros, Frustules.

A new method utilizing a muffle furnace at 560 plus or minus 10C for 15 to 20 minutes to clear diatoms for taxonomic study is presented. This technique allows for exceptionally well cleared frustules for all the diatoms studied. It also allows phytosociological studies to be made of the colonization and succession of the diatoms on the exposed slides or coverslips from various aquatic habitats. This method has been used only for the moderate and heavily silicified diatom frustules, and it has not been tested for the delicate frustules of Rhizosolenia, Attheya, and Chaetoceros. (Holoman-Battelle)

AN IN SITU METHOD FOR MEASURING PRIMARY PRODUCTIVITY OF ARCTIC SEA ICE ALGAE,
Alaska Univ., College. Inst. of Marine Science.
R. C. Clasby, R. Horner, and V. Alexander.
Journal of the Fisheries Research Board of Canada, Vol 30, No 6, p 835-838, June 1973. 2 fig, 12 ref.

Descriptors: *Primary productivity, *Ice cover, *Marine algae, *On-site tests, *Methodology, On-site data collections, Light intensity, On-site investigations, Measurement, Radioactivity techniques, Scuba diving, Arctic Ocean, Testing procedures.
Identifiers: *Photosynthetic rates, C-14, Chlorophyll a.

An in situ technique has been devised for measuring the primary productivity of the ice algal community in the Arctic Ocean. A combined sampler-incubation chamber constructed of plexiglass was screwed into the underside of the ice to a depth of 2 cm by SCUBA divers. The above chamber was inoculated with C-14-bicarbonate for primary productivity experiments. In order to measure photosynthetic rates under varying light conditions, rectangular plexiglass boxes were suspended beneath the ice from ice pitons. The incubation chambers were placed in these boxes without being surfaced and the boxes were wrapped with perforated metal screening to simulate various light intensities. There was a slight increase in primary productivity rates over the range of 13-66 lux. Above 66 lux the rate increased sharply. It was also noted that productivity rates ranged from 7.67-mg C/sq m hr near the peak of the bloom to a low of 0.30-mg C/sq m hr just prior to the thaw period. (Holoman-Battelle)

ION SELECTIVE FLOW-THROUGH ELECTRODES: CONSTRUCTION AND PROPERTIES OF HEAVY METAL SENSORS,
State Univ. of New York, Buffalo. Dept. of Chemistry.
H. Thompson, and G. A. Rechnitz.
Chemical Instrumentation, Vol 4, No 4, p 239-253, 1973. 5 fig, 3 tab, 17 ref. EPA R-800991.

Descriptors: *Chemical analysis, *Electrodes, Ionexchange, *Copper, *Cadmium, *Lead, Fabrication, Heavy metals, *Pollutant identification, *Instrumentation.
Identifiers: Ion-selective electrodes, Flow-through electrodes.

The construction and properties of silver sulfide matrix flow-through electrodes for copper, cadmium, and lead are discussed in detail. A comparison of electrode response in the dipping and flow-through configurations is made and various aspects of pellet preparation, mounting, reference conditions, conditioning, and surface polishing are evaluated. Response times of 5 sec were obtained at flow rates of 1 to 10 ml/sec. Possible applications include automated continuous sample analysis and reaction rate studies. (Hoover-EPA)

TECHNIQUES FOR THE SAMPLING AND HANDLING OF ANAEROBIC MICROBES IN WASTE FERMENTATION SYSTEMS,
Kentucky Univ., Lexington. Dept. of Agricultural Engineering.
H. E. Hamilton, I. J. Ross, and S. W. Jackson.
Transactions of ASAE, (American Society of Agricultural Engineers) Vol 16, No 1, p 172-175, 1973, 9 fig, 4 ref.

Descriptors: Autoclaves, *Farm wastes, *Poultry, Livestock, Anaerobic conditions, *Fermentation, Analytical techniques, Dilution, Waste treatment.
Identifiers: Rumen sampling, Fermentor sampling, Test tubes, Pipetting device, Inoculation, *Microbial growth, Colony counting, Chemical changes.

An equipment and technique experiment involved the fermentation of autoclaved chicken excreta with rumen microbes obtained from a fistulated steer being fed a diet containing 23% chicken manure. The equipment pictured and described was designed and constructed for improving the efficiency of preparing test tubes for enumerating microbes in the fermented samples. This equipment successfully aided in the experiments requireing rapid handling and processing of large numbers of samples. (Frantz-East Central)

A METHOD FOR THE DETERMINATION OF STRONTIUM-90 AND CESIUM-137 IN RIVER SEDIMENTS AND SOILS,
Atomic Energy of Canada Ltd. Chalk River (Ontario). Chalk River Nuclear Labs.
W. E. Grummitt, and G. Lahaie.
Available from NTIS, Springfield, Va., as AECL-4365; $4.00 in paper copy, $1.45 in microfiche. Report AECL-4365, March 1973. 14 p, 1 tab, 7 ref.

Descriptors: *Radiochemical analysis, *Soil contamination, *Fallout, *Nuclear wastes, Radioactivity techniques, Separation techniques, Analytical techniques, Soil analysis, *Strontium radioisotopes, Sediments.
Identifiers: *Cesium radioisotopes.

The sensitivity by beta counting is about 0.1 picocurie per 100 g, greater than by gamma spectroscopy, which is applicable only for Cs137. Sample preparation for counting included ashing to remove organic matter, treating with fuming hydrofluoric acid to remove silica, then alkali fusion to separate Cs from Sr, and finally radiochemical separation. Determination of Sr85 (added as tracer) and Cs137 by the alternative method of gamma spectroscopy indicated a chemical yield of 65-80% of the radioactivity. (Bopp-ORNL)

YERSINIA ENTEROCOLITICA IN DRINKING--WATER,
Statens Institutt for Folkehelse, Oslo (Norway).
J. Lassen.
Scand J Infect Dis. Vol 4, No 2, 125-127, 1972.
Identifiers: *Yersinia-Enterocolitica, *Potable water, Cultures, *Disease vector, Serotypes.

Fifty drinking-water specimens, selected at random, were examined for Y. enterocolitica in Feb. 1970 and April 1971. Eleven cultures were isolated from 10 of these specimens which on a serological and/or biochemical basis could be classified as Y. enterocolitica. Two of these cultures were antigenically identical with previously described serotypes (serotypes 7 and 13), 7 showed antigenic relationship to serotypes previously described although they were not identical (serotypes 2,4,6 and 16) while the 2 remaining cultures represented new serotypes. The serotypes which are most frequently found in human Y. enterocolitica infections were not shown in these specimens selected at random, but it presumed that these serotypes can also be conveyed through drinking-water.--Copyright 1973, Biological Abstracts, Inc.

PHOSPHATE RETENTION BY LAKE SEDIMENTS,
Maine Univ., Orono. Dept. of Plant and Soil Sciences.
E. G. Lotse.
Available from the National Technical Information Service as PB-223 880, $3.50 in paper copy, $1.45 in microfiche. Maine University Land and Water Resources Center, Orono, Project Completion report, June 1973. 36 p, 28 fig, 4 tab, 49 ref. OWRR A-016-ME (1).

Descriptors: *Lake sediments, *Phosphates, *Chemical reactions, *Maine, Retention, Bottom sediments, Chemical properties, Physical properties, Hydrogen ion concentration, Phosphorus, Adsorption, Model studies, Equations, Calcium carbonate, Filters, Fluorides, Calcium compounds.
Identifiers: Phosphate retention.

Phosphate retention by sediments from Sebasticook Lake, Maine, calcium carbonate, and Ca-kaolinite could be described by the Langmuir isotherm at low phosphate concentrations. Phosphate retention by hematite and gibbsite could be described by the Freundlich isotherm. The calculated maximum surface saturation was 1600 microgram/g and 850 microgram/g for two sediment samples, 25 microgram/g for calcium carbonate, and 187 microgram/g for Ca-kaolinite. A second order kinetic equation was developed to describe the rate of phosphate adsorption by calcium carbonate and Ca-kaolinite. A two-constant rate equation was developed to describe the kinetics of phosphate adsorption by sediments, hematite, and gibbsite. The activation energy of adsorption was between 2 and 3 kcal/mole. This indicates that phosphate adsorption is a diffusion-controlled process. The desorption of phosphorus from minerals and sediments was dependent on the anionic species present in the solution. The replacing power of the anions appeared to be related to their ionic potential and complexing ability. The rate of desorption could be described by the proposed two-constant rate equation. The efficiency of phosphate removal by calcium fluoride was 99% or higher at concentrations ranging from 4 to 100 ppm P and pH values of 2.1 to 11.7. Thus, it appears that calcium fluoride can be used as a filter for phosphate removal from waste effluents (Woodard-USGS)

J. A. Northby.
Available from National Technical Information Service as PB-223 965, $2.75 in paper copy, $1.45 in microfiche. Rhode Island Water Resources Center, Kingston, Final Report, 1973. 6 p. OWRR B-039-RI (1). 14-31-0001-3643.

Descriptors: Instrumentation, *Fluorescence tracers, *Rhode Island, *Dye releases, *Path of pollutants.
Identifiers: *Polarized tracers, *Polarization, Providence River (R.I.), Narragansett Bay (R.I.).

Polarization properties are reported of the background fluorescence of natural water samples obtained from the Providence River and Narragansett Bay. These properties appear to be subject to the same spatial and temporal variability as the unpolarized background fluorescence. Consequently, it is unlikely that significant improvement in the sensitivity of detection of tracer dyes in polluted water can be achieved by using a dye whose polarization properties are complimentary to those of the background.

DISTRIBUTION AND LEVELS OF LEAD AND ARSENIC IN GRAND TRAVERSE BAY, LAKE MICHIGAN BOTTOM SEDIMENTS,
Illinois Inst. of Tech., Chicago. Dept. of Environmental Engineering.
J. R. Marsh, and R. A. Minear.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 1, p 1-4, 1973. 1 fig, 1 tab, 5 ref.

Descriptors: *Arsenic compounds, *Bottom sediments, *Lake Michigan, *Arsenicals (Pesticides), Pesticide residues, Path of pollutants.
Identifiers: *Grand Traverse Bay (Lake Michigan).

Up to 114,000 pounds of lead arsenate pesticides are applied each year to approximately 17,000 acres of sweet and tart cherry orchards in the Grand Traverse Bay, Michigan drainage area. Sediment samples were taken from the top three inches of the sediments at 18 sampling stations throughout the bay. The background values for ar-

senic are from 0-1.0 mg of As per kg of sediment, dry weight, with an average concentration of 0.2 mg per kg. Background lead concentrations range from 2-65 mg per kg, with an average of 27.3 mg per kg. Measured arsenic concentrations ranged from 0.2-8.5 mg of As per kg sediment, dry weight, with yearly averages ranging from 2.3-3.5 mg per kg. In general, the concentrations seem to correspond to the use patterns, although the sediment type exerts considerable influence. (Knapp-USGS)

INVESTIGATION OF HEAVY METAL-SLUDGE COMPLEXATION CONSTANTS BY CATION EXCHANGE,
Illinois Inst. of Tech., Chicago.
M. H. Cheng, J. W. Patterson, and R. A. Minear.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 3, p 14-24, 1973. 4 fig, 3 tab, 6 ref.

Descriptors: *Chelation, *Heavy metals, *Sludge, *Cation exchange, Sewage sludge, Path of pollutants, Adsorption, Organic matter.
Identifiers: Complexing (Chemical).

Determination of complexation constants of activiated sludge and process supernatant with heavy metals provides a useful tool for quantitative assessment of the interaction between metals contained in combined sewage, and organic matter of the sludge and liquid phases. Cation-exchange techniques were employed to measure stability constants of metal-supernatant and metal-sludge complexes. The affinity of the sludge for metal ions is strong, and dependent upon several factors including pH and the concentrations of organic matter and metals present in the system. The stability of complexation was assessed by adding known competing chelating agents, such as EDTA, NTA, and glycine. The complexing strength of activated sludge with the metals is relatively less than for these chelating agents. The sludge mass possesses great ability to concentrate metal ions from wastewater, with a rapid first phase of uptake occurring within three to ten minutes, followed by a long period of slower uptake. (Knapp-USGS)

SOME REACTIONS OF CHLORINE AND OXY--CHLORINE SPECIES WITH ORGANIC COMPOUNDS IN AQUEOUS MEDIA,
Army Environmental Hygiene Agency, Aberdeen Proving Ground, Md.
D. H. Rosenblatt.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 51, p 186-189, 1973. 11 ref.

Descriptors: *Chlorination, *Oxidation, *Disinfection, *Waste water treatment, Chlorine, Water treatment, Aqueous solutions.
Identifiers: *Chlorine dioxide, Chlorites.

Chlorine, along with bromine and iodine, reacts reversibly with water. The oxidizing power of the parent element is preserved in a number of ionic and molecular species. In addition to these species, two others derivable from chlorine through a relatively easy and practical series of reactions are chlorite ion and chlorine dioxide. The nature of all reactant species present in a solution, as well as their absolute and relative concentrations, must be considered to predict the behavior of chlorine and reactive oxygen-chlorine compounds with organic substances. THE CHEMISTRY OF AQUEOUS NITROGEN TRICHLORIDE,
Harvard Univ., Cambridge, Mass. Div. of Engineering and Applied Physics.
J. L. S. Saguinsin, and J. C. Morris.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 52, p 190-191, 1973.

Descriptors: *Chlorine, *Chlorination, Chemical reactions, *Water treatment, Waste water treatment, Water chemistry, Potable water, Swimming pools, Aqueous solutions.
Identifiers: *Chloramines.

The formation of NC13 during water chlorination is of particular interest due to the nuisance character of this chlorine compound. Even when present at very low concentrations, it contributes undesirable taste and odor to drinking water and irritates the mucous membranes when present in swimming and bathing waters. Rate constants were obtained as a function of pH and temperature. Overall reaction orders as well as those for each reactant were obtained. Activation energies were derived from changes in values of the rate constant with temperature. The specific formation of NC13 is a very slow reaction, much slower than the formation of NH2Cl and NHC12. The reaction is not strongly pH dependent in the acid range studies. (Knapp-USGS)

GEOLOGIC APPRAISAL OF PARADOX BASIN SALT DEPOSITS FOR WASTE EMPLACEMENT,
Geological Survey, Denver, Colo.
R. J. Hite, and S. W. Lohman.
Open-file report (USGS-4339-6), 1973. 75 p, 16 fig, 2 tab, 30 ref. USAEC Agreement AT (40-1)-4339.

Descriptors: *Waste disposal wells, *Injection wells, *Nuclear wastes, *Utah, *Colorado, Data collections, Geological surveys, Geologic formations, Geomorphology, Groundwater movement, Sedimentology, Underground waste disposal.
Identifiers: *Paradox basin (Utah and Colo), *Salt deposits.

This report is one of a series summarizing available geologic and hydrologic knowledge of certain salt deposits to help determine their suitability for waste emplacement. Thick salt deposits of Middle Pennsylvanian age are present in an area of 12,000 square miles in the Paradox basin of southeast Utah and southwest Colorado. The presence of thick cap rock over many of the salt anticlines is evidence of removal of large volumes of halite by groundwater. This is a relatively slow process and any waste-storage of disposal sites in these structures should remain dry for hundreds of thousands of years. Oil and gas in trace to commercial quantities occur in all of the black shale, dolomite, and anhydrite beds of the Paradox Member. These hydrocarbons constitute a definite hazard in the construction and operation of underground waste-storage or disposal facilities. However, many individual halite beds are of sufficient thickness that a protective seal of halite can be left between the openings and the gassy beds. A total of 12 different localities were considered to be potential waste-storage of disposal sites in the Paradox basin. Two of these sites, Shafer dome and Salt Valley anticline were considered to have the most favorable characteristics. (Woodard-USGS)

THE EFFECT OF SORPTION ON THE MIGRATION OF BE-7 FROM A HIGH ENERGY ACCELERATOR CONSTRUCTED ON A CHALK SITE,
Rutherford High Energy Lab., Chilton (England).
G. B. Stapleton, and R. H. Thomas.
Water Research, Vol 7, No 9, p 1259-1268, September 1973. 4 fig, 3 tab, 18 ref.

Descriptors: *Sorption, *Radioisotopes, *Path of pollutants, *Groundwater movement, *Beryllium, Radioactive wastes, Leaching, Limestones, Permeability, Water chemistry.

The radioactive nuclides produced in rock surrounding a high energy accelerator installation may migrate from the accelerator environs if subjected to the hydraulic gradients of groundwater. Under such conditions it might be possible for groundwater systems to become contaminated by long-lived radionuclides. In the migration of Be-7, an important radionuclide produced in accelerator shields, through ground predominantly composed of chalk, sorption is dominant in minimizing leach rates. In equilibrium studies, solutions of beryllium were shaken with weighed amounts of chalk powder and the equilibrium concentration on the chalk with respect to water was determined. Experiments were also performed in which water was continuously passed through long columns of chalk to elute a band of beryllium placed at the top of the chalk column. The values of sorption obtained in both the static and dynamic experiments indicate that Be-7 would move through chalk at a velocity many orders of magnitude slower than the groundwater. It would take 650 years for Be-7 to move a distance less than 1 m through the rock. Because the radioactive half life of Be-7 is only 53.4 days, the rate of migration is so slow that radioactive decay will reduce the original activity of negligible levels. (Knapp-USGS)
W73-14821

OXYGEN UPTAKE OF BOTTOM SEDIMENTS STUDIED IN SITU AND IN THE LABORATORY,
Uppsala Univ. (Sweden). Inst. of Limnology.
N. Edberg, and B. V. Hofsten.
Water Research, Vol 7, No 9, p 1285-1294, September 1973. 5 fig, 3 tab, 23 ref.

Descriptors: *Oxygen demand, *Bottom sediments, *Organic matter, Oxidation, On-site tests, Laboratory tests, Instrumentation, Biodegradation, Biochemical oxygen demand, Brackish water.

Oxygen uptake by soft bottom sediments was measured in situ with an oxygen electrode in a bell jar. Values in the range of 0.3-3.0 grams of oxygen per sq m per day were obtained at 19 localities in freshwater and brackish water. Comparative measurements were made in the laboratory on sediment cores. These gave consistently lower values than the in situ measurements. Laboratory experiments showed that the oxygen uptake depended on the oxygen concentration and that the temperature coefficient decreased with increasing temperature. There was no simple correlation between oxygen uptake and content of organic matter in sediments. (Knapp-USGS)

SOIL BACTERIA IN LAND-DRAINAGE WATER,
West of Scotland Agricultural Coll. Auchincruive (Scotland). Dept. of Microbiology.
M. R. Evans, and J. D. Owens.
Water Research, Vol 7, No 9, p 1295-1300, September 1973. 2 fig, 1 tab, 8 ref.

Descriptors: *Drainage, *Soil bacteria, Runoff, *Return flow, *Drainage water, Washouts, Discharge frequcney, Monitoring, *Subsurface drainage.

The rate of discharge and the concentration of viable soil bacteria in the water from a subsurface field drain were monitored for 4 months during winter. The concentration of bacteria in the water was related to the flow of the discharge. The total number of viable bacteria in the drainage water discharged during the 4 months represented approximately 0.1% of an estimate of the total number of viable bacteria present in the soil of the experimental plot. The numbers of bacteria lost from soil by washout in drainage water were an insignificant fraction of the probable annual production of bacteria in the soil. (Knapp-USGS)

MIXING PROCESSES IN WIDE OPEN CHENNELS,
State Inst. of Hydrology and Meteorology, Warsaw (Poland).
W. Czernuszenko.
Journal of Hydrology, Vol 19, No 3, p 259-268, July 1973. 4 fig, 1 tab, 10 ref.

Descriptors: *Mixing, *Diffusion, *Open channel flow, Turbulent flow, Mathematical models, Hydraulic models, *Path of pollutants, Dispersion, Dye dispersion, Channels.
Identifiers: Channel walls.

Two cases of stream diffusion were analyzed under conditions of turbulent flow in an open channel. The cases were: (1) a source of pollution placed in the channel axis, and (2) the source at the wall. The flume was wide enough so that the cloud of dye injected near the axis did not reach the area near the wall in the studied section. The mixing process was described by a well-known equation for turbulent diffusion. The measured diffusion coefficient increases with the distance from the source. The mathematical model is entirely compatible with the results obtained from model research. Greater discrepancies between the model and the computed values occur, however, in case of a rectangular source placed at the channel wall. This is due to more complex flow conditions near the channel wall. (Knapp-USGS)

TURBULENT ENTRAINMENT IN BUOYANT JETS AND PLUMES,
California Inst. of Tech., Pasadena. Dept. of Environmental Engineering.
E. J. List, and J. Imberger.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY9, Paper 9992, p 1461-1474, September 1973. 1 tab, 24 ref, append. NSF Grant GK-35774X.

Descriptors: *Mixing, *Jets, *Diffusion, *Path of pollutants, *Entrainment, Turbulent flow, Turbulence, Convection, Density, Outlets, Outfall sewers.
Identifiers: Submerged flow, *Plumes.

The behavior of turbulent buoyant jets in uniform density environments is governed by an entrainment function and buoyance function, both of which are functions of the local jet densimetric Froude number and the local jet spreading angle. For plumes, Batchelor's analysis was used to show that the local Froude number and jet angle are constant. These two facts were then used to show that the buoyancy and entrainment functions in plumes are also constant and that their values can be deduced from an experimental velocity profile alone. Experimental results were used to show that the jet (an axisymmetric buoyant jet) is virtually independent of elevation and this result leads to the conclusion that the entrainment function is linearly dependent on the inverse of the local jet Froude number. The buoyancy function is constant, with the value 1.16 for axisymmetric buoyant jets. (Knapp-USGS)

In: Trace Substances in Environmental Health-V, D.D. Hemphill, Editor, University of Missouri, Columbia, p 143-152, 1972. 2 fig, 2 tab, 12 ref. OWRR A-023-MO (2).

Descriptors: Streams, *Mine water, *Lead, *Zinc, *Lagoons, Water pollution, *Waste water treatment, Mining, Trace elements, Discharges (Water), Effluents, Environmental effects, Data collection, Evaluation, Water treatment, Heavy metals, Algae, Benthic organisms, *Missouri.

In stream pollution studies carried out in the 'New Lead Belt' of S.E. Missouri, data were collected to evaluate the effects of trace substances in wastes of lead-zinc mining operations, the charcter of individual wastes, and the effectiveness of stabilization lagoons in treating discharges. Samples from mine discharge water, combined mine-mill effluent, lagoon system effluent and streams below the mine lagoons were taken and compared with control site samples from unpolluted streams. Biological, chemical and physical parameters were evaluated along with trace metal determinations of lead, zinc and copper. Mining wastewater contains carbon dioxide and sufficient phosphorous to combine with nitrogen present in stream water and cause undesirable benthic growths in bacterial-algal mats. Recommendations include recycling of milling waste water and separate treatment of mine discharge water; treatment of tailings waste water and baffled or submerged discharge outlets; and final treatment lagoons to remove colloidal material, trace substances and metals by biological treatment. EFFECTS OF SANITARY LANDFILLS ON GROUND AND SURFACE-WATER MOVEMENT AND WATER QUALITY,
Indiana Univ., Bloomington. Dept. of Geology.
R. V. Ruhe.
Available from the National Technical Information Service as PB-223 871, $3.00 in paper copy, $1.45 in microfiche. Indiana Water Resources Research Center (West Lafayette) Completion Report, September 1, 1972. 11 p, 7 fig. OWRR B-034-IND (1). 14-31-0001-3584.

Descriptors: *Landfills, *Path of pollutants, *Indiana, Sampling, Water quality, Water pollution control, Garbage dumps, Water pollution sources.

Two sanitary landfill areas in Indiana were instrumented and data were collected. The Monroe County Landfill is located along Anderson Road almost 7.7 miles northeast of Bloomington, Indiana on the north valley slope of Beanblossom Creek. Groundwater is sampled in monitoring wells, and surface water is sampled at selected weir sites. The Columbus Indiana Landfill is located at the base of a terrace scarp in the White River Valley. A series of double-level dikes were constructed to contain the fill. Monitoring wells were installed on the terrace, in the fill proper, and around the margin of the fill. (Knapp-USGS)

AN INVESTIGATION OF SELECTED PHYSICAL AND CHEMICAL CHARACTERISTICS OF TWO SUBARCTIC STREAMS,
Alaska Univ., College. Inst. of Water Resources.
L. A. Peterson.
Available from the National Technical Information Service as PB-224 047, $12.00 in paper copy, $1.45 in microfiche. M.S. Thesis May 1973. 185 p, 32 tab, 15 fig, 58 ref, 4 append. OWRR B-017-ALAS (4).

Descriptors: *Alaska, Streams, Chemical properties, Physical properties, Water temperature, *Water quality, Alkalinity, Conductivity, Solids, Dissolved oxygen, *Nutrients, Turbidity, Subarctic, Hydrogen ion concentration.
Identifiers: *Goldstream Creek (Alas), *Chatanika River (Alas).

The objectives were to delineate baseline physical and chemical characteristics of the Chatanika River and Goldstream Creek, ascertain the source of nutrients in the streams from breakup to freezeup, delineate any significant local variation within each stream and compare the physical and chemical characteristics between the streams. The concentrations of the selected physical and chemical parameters were generally low in both streams, remaining within expected levels of unpolluted fresh water streams in the Chatanika River. Five parameters exceeded expected levels of unpolluted fresh water streams at two or more sample sites on Goldstream Creek. The concentrations of nutrients in both streams were generally quite low from breakup to freezeup; there were no important single point sources of nutrients in the Chatanika River or Goldstream Creek. The Chatanika River did not exhibit any significant local variation in water quality in the study area. Two tributaries of Goldstream Creek and one area within Goldstream Creek exhibited significant local variation in water quality, which was caused by groundwater inflow of different quality at the three locations. The major differences in water quality between the Chatanika River and Goldstream Creek are due to topography and soil types, which cause surface and groundwater movement through Goldstream Valley to be slower than through the Chatanika River valley, resulting in

ifferent quality surface and groundwaters enter- g these streams. The quality of the water in the natanika River is such that it would be an ac- ptable source for domestic and most industrial ters, and would be able to assimilate some ste without undue degradation of the water ality. Goldstream Creek should not be con- lered as a source for water or for waste assimila- n due to low flow and poor water quality during nter.

SEMI-CONTINUOUS CULTURE OF BACTERIA ON MEMBRANE FILTERS: I. USE FOR THE BIOASSAY OF INORGANIC AND ORGANIC NUTRIENTS IN AQUATIC ENVIRONMENTS,
Warsaw Univ. (Poland). Zaklad Microbiologica Wody Sci.
W. Kunicka-Goldfinger, and W. Kunicki-Goldfinger.
Acta Microbiol Pol Ser B Microbiol Appl. Vol 4, No 2, p 49-60, 1972, Illus.
Identifiers: *Aquatic bacteria, *Bioassay, Cultures, Environment, Filters, Growth, Inorganic nutrients, *Membrane filters, Monods, *Nutrients, Organic nutrients.

An apparatus for quasi-continuous growth of bacteria on membrane filters is described. The suitability of the device for bioassay of the major nutrients (C, N and P) in water and for the study of the effects of trace amounts of pollutants was examined. The results were calculated on the basis of Monod's formula and Lineweaver-Burke transformation, and values of maximum growth rates and saturation constants were obtained. The highest sensitivity of the proposed method was reached for a carbon source concentration of 0.1 mg of C/liter, nitrogen source 0.0013 mg of N/liter, phosphorus source (as PO3/4) 0.0006 mg/liter.--Copyright 1973, Biological Abstracts, Inc.

PHOSPHORUS FLUX ACROSS A CORAL REEF,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
M. E. Q. Pilson, and S. B. Betzer.
Ecology, Vol 54, No 3, p 581-588, 1973. 5 fig, 5 tab, 28 ref.

Descriptors: *Productivity, *Phosphorus, *Adsorption, *Marine algae, Photosynthesis, Metabolism, Reefs, Oxygen, Respiration, Balance of nature.
Identifiers: *Coral reef, Muti Island (Eniwetok Atoll).

Measurements of phosphorus concentration in seawater before and after the water had passed over the shallow windward coral reef flat north of Muti Island (Eniwetok Atoll) are reported. One transect was close to that previously studied by Odum and Odum; another a few kilometers away. Simultaneously with the sampling at the reef front, collections were made at the lagoon end of the transect. Samples were taken from just under the surface and from about 10-20 cm above the bottom. Current and depth measurements were converted to values for the volume transport across 1 meter of reef front. The phosphorus concentrations did not vary in proportion to the photosysnthesis and respiration activities of the reef community. There were no detectable changes in either reactive or organic phosphorus between upstream and downstream ends of a transect across a relatively rich coral region, but on a transect across a predominantly algal-covered area there was a slight decrease in reactive phosphorus and slight increase in organic phosphorus. There were no detectable diurnal variations. This remarkable constancy suggests that the plants take up phosphorus at a nearly constant rate. (Jones-Wisconsin)

ATMOSPHERIC REAERATION IN NATURAL STREAMS,
Nebraska Natural Resources Commission, Lincoln. Data Bank.
M. K. Bansal.
Water Research, Vol 7, p. 769-782, 1973. 7 fig, 5 tab, 26 ref.

Descriptors: *Reaeration, *Self-purification, *Streams, *Mathematical studies, Dispersion, Hydraulics, Equations, Reynolds number, Path of pollutants.
Identifiers: *Atmospheric oxygenation, *Reaeration coefficient.

The dispersion of a pollutant in a stream by the fluid turbulence and nonuniformity of velocity distribution of the flow and the capacity of a stream to reaerate itself are the two key factors which affect the quality of stream water. The reaeration phenomenon in a natural stream is analogous to the dispersion mechanism, as both of these characteristics are related to the Reynolds number. The vertical dispersion parameter or the longitudinal dispersion parameter are found to be linearly related to the reaeration parameter on a log-log plot. The applicability of the relationship thus evolved is independent of regional location and takes into account both the physical and flow characteristics of the stream. An attempt is made to define a better empirical relationship of the reaeration coefficient; first with the flow characteristics and later with the dispersion characteristics of the stream. The results make possible the determination of the reaeration coefficient for a river from the known dispersion characteristics. (Auen-Wisconsin)

A NUMERICAL MODEL OF ESTUARINE POLLUTANT TRANSPORT,
California Univ., Berkeley. Dept. of Civil Engineering.
H. B. Fischer.
In: Proceedings of the 13th Coastal Engineering Conference, July 10-14, 1972, Vancouver, B.C., p 2265-2271 (1972). 8 ref.

Descriptors: *Mathematical models, *Estuaries, *Path of pollutants, Movement, Dredging, Velocity, Dispersion, *Australia, Dimensions, Time.
Identifiers: *Botany Bay (Australia).

A two-dimensional, non-time averaged model, is computatively fast, seems to be reasonably accurate, and can be used to predict the effect of permanent changes wherever a two-dimensional representation is satisfactory. The two-dimensional models discussed average only over the vertical dimension, so that the velocity and concentration are considered to be functions of the two horizontal dimensions and time, but not of the vertical dimension. An attempt is made to simulate the physical processes of transport and dispersion of constituents in estuaries. The time step used is long, permitting simulation of a long period of real time. Accuracy can probably be improved by shortening the time step and increasing the degree to which the details of convective transport are modeled. The model is presently being applied to several real estuaries with the hope that further development will provide a useful tool for water quality studies. (Jones-Wisconsin)

KRAFT MULTISTAGE BLEACH PLANT EFFLUENTS,
Institute of Paper Chemistry, Appleton, Wis.
G. A. Nicholls.
Tappi, Vol 56, No 3, p 114-119, March 1973. 2 fig, 3 tab, 40 ref.

Descriptors: *Bleaching wastes, *Pulp wastes, *Waste water treatment, *Water pollution treatment, *Pollution abatement, Industrial wastes, Pulp and paper industry, Recycling, Water conservation, Costs, Oxygen, Toxicity, Biochemical oxygen demand, Closed conduits, Water reuse, Oxidation, Chlorination, Chlorine, Effluents, Reverse osmosis, Chlorides, Engineering, Color.
Identifiers: Oxygen pulping, Oxygen bleaching, Spent pulping liquors, Process technology, Pulping.

The volume, concentration, chloride content, toxicity, BOD, and color of kraft mill multistage bleach plant effluents are discussed with respect to the development of closed-process technologies. 'Out-plant' bleaching effluent treatments are discussed, and their significant addition to production costs is illustrated. Among alternative 'in-plant' treatments, recent developments comprise reductions in bleach effluent volume, two engineering approaches to oxygen bleaching, the recirculation of bleach effluent in the pulp mill system, and oxidative pulping-bleaching. The volume of bleaching effluents is much greater than that of spent pulping liquors, but might be halved if water input for low-consistency (low-density) chlorination could be eliminated. With oxygen bleach, closed-process technology for semibleached kraft pulp is on the horizon, and effluents from multistage bleaching sequences are significantly reduced in pollution character. If bleach plant effluents are to be recycled, their volume must be reduced, perhaps by reverse osmosis concentration, and their chloride content must be eliminated. Oxidative wood delignification is another future possibility for closed-process combined pulping-bleaching. (Brown-IPC)

ORIGIN OF TOXIC MATERIALS IN THE KRAFT PULPING PROCESS,
British Columbia Research Council, Vancouver.
A. Bruynesteyn, C. C. Walden, and D. A. Hill.
Pulp and Paper Magazine of Canada, Vol 73, No 11, p 97-101 (Technical Paper T347), Nov. 1972. 8 fig, 8 tab, 13 ref.

Descriptors: *Toxicity, *Pulp wastes, *Bleaching wastes, *Evaporators, *Water pollution sources, *Pollutant identification, Pulp and paper industry, Foaming, Industrial wastes, Liquid wastes, Waste water (Pollution), Pollutants, Water pollution.
Identifiers: Kraft mills, Kraft pulping, *White water, Paper machines, Condensates, *Black liquor, Spent liquors, Seasonal variations.

Toxicities of effluents from bleached kraft pulp mills have been noted by many investigators to vary greatly with time. Causes of these variations were studied with unbleached white water (paper machine effluent) and its components. Results indicated that evaporator condensate was the major toxic constituent, followed by residual black liquor (spent cooking liquor). Seasonal variations in toxicity could be correlated with variations in evaporator foaming which, in turn, was responsible for much of the toxicity transfer. (Brown-IPC)

SOME FACETS OF THE IMPACT OF PULP MILL EFFLUENT ON THE ALBERNI INLET,
Fisheries Research Board of Canada, Nanaimo (British Columbia).
R. R. Parker, D. H. Heller, C. R. Horwood, and J. G. Sanderson.
Pulp and Paper Magazine of Canada, Vol 73, No 10, p 89-99 (Technical Paper T289), Oct. 1972. 16 fig, 1 tab, 20 ref.

Descriptors: *Pulp wastes, Waste water (Pollution), *Effluents, *Dissolved oxygen, *Water pollution effects, *Oceanography, Pulp and paper industry, Wastes, Model studies, Mathematical models, Mathematical studies, Light, Fish, Salmonoids, *Canada, Liquid wastes, Water pollution sources, Pacific coast region, Aquatic life, Aquatic animals, Industrial wastes, Discharge (Water), Monitoring.
Identifiers: *Albernie Inlet (B.C.), Vancouver Island, British Columbia, Halocline, Sunlight.

The waters of Alberni Inlet, on the west coast of Vancouver Island, about 80 miles northwest of Victoria, have been monitored for distribution of pulp mill effluent, various oceanographic factors, and dissolved oxygen (D.O.) concentrations over a range of varying conditions, including periods before and after construction of the pulp mill. Effluent distributions were shown to be in accord with the oceanographic studies and with the predictions on the basis of which the mill had been originally designed. An attempt to relate the D.O. supply and demand in a mathematical model was only partly successful. While the mill is operating, the D.O. is reduced in the stratum immediately at the bottom of and below the halocline, compared to premill conditions. However, the fact that this stratum is virtually free of mill effluent precludes direct contamination. Rather, the oxygen depletion is attributable to reduced penetration of sunlight, owing to the presence of effluent in the upper zone of the Inlet. The vitality of salmonoid fish populations did not seem to have been impaired by the pulp mill operation. (Brown-IPC)

MERCURY CONCENTRATIONS IN DATED VARVED MARINE SEDIMENTS COLLECTED OFF SOUTHERN CALIFORNIA,
Southern California Coastal Water Research Project, El Segundo.
D. R. Young, J. N. Johnson, A. Soutar, and J. D. Isaacs.
Nature, Vol 244, No 5414, p 273-275, Aug. 3, 1973. 1 fig, 11 ref.

Descriptors: *Sediments, *Mercury, Oceans, Cores, Sampling, Age, Dating, Metals, Neutron activation analysis, Atomic absorption spectrometry, Toxins, Trace elements, Marine geology, Industrial wastes, Pollutants, Pacific Coast Region, Stratification, History, Mining, Water pollution sources, *California.
Identifiers: *Santa Barbara basin (Calif).

Core samples from differently aged strata, up to 1500 years old, were gathered in the anoxic Santa Barbara Basin, about 100 miles northwest of Los Angeles, and analyzed for mercury by two different techniques which gave substantially agreeing results. A distinct increase in mercury level toward the surface layers was observed. The baseline value for the 19th century was 0.06 plus or minus 0.01 mg/dry kg. The layers deposited since 1950 contained about twice this amount of mercury. The increase is attributed to human mining and industrial activities, in agreement with findings by other investigators who analyzed dated glacial samples from Greenland. (Brown-IPC)

ECOLOGICAL IMPLICATIONS OF FALLOUT RADIOACTIVITY ACCUMULATED BY ESTUARINE FISHES AND MOLLUSKS,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
C. L. Schelske, D. A. Wolfe, and D. E. Hoss.
Available from NTIS, Springfield, Va., as COO-2003-9; $4.00 in paper copy, $1.45 in microfiche. Report COO-2003-9, 1972. 40 p, 3 fig, 7 tab, 32 ref.

Descriptors: *Zinc radioisotopes, *Fallout, *Estuarine environment, *Marine animals, Absorption, Path of pollutants, Physicochemical properties, Molluscs, Marine fish, Gamma rays, Food chains, Nuclear wastes.
Identifiers: Manganese radioisotopes, Cerium radioisotopes, Ruthenium radioisotopes, Cesium radioisotopes.

Gamma-emitting radionuclides in estuarine organisms from near Beaufort, North Carolina, were measured using a 10-x-10-cm NaI (Tl) crystal and 0.5-to-2.5-kg samples. Fish samples were taken from commercial catches and were retained 2 years before measuring. Relatively high concentrations were: Cs137 in nektonic feeding fish; Mn54 in benthic feeding fish; Zn65 in oysters; Mn54 in bay scallops, and Ce144 and Ru106 in clams, mussels, and oysters. Of the 18 fish species studied, 5 were not measured since their radionuclide concentrations were relatively low. The differences in uptake between the different species are accounted for by differences in chemical composition, metabolism, and life cycle. The data show that knowledge of the physicochemical form of a radionuclide is required to predict its uptake. (Bopp-ORNL)

Identifiers: Inhalation.

The proposed rule is that under steady-state conditions the ratio between different hydrogen isotopes in various components of biological systems is essentially constant. Further studies are needed to test the validity of this proposed rule. Until confirmed, a basic prerequisite to general use of this proposed rule is that the radiation dose to the public is sufficiently small so that an averaging process can be used for environmental tritium. The underlying concept for this rule is not new as the EPA and its predecessor organizations have used this assumption for dose estimates related to environmental tritium. The appropriate equation is as follows: $H \pm 0.1\ QC$, where H is the dose equivalent in mrem/a, Q the quality factor, and C the tritium concentration in body water in pCi/ml. (Houser-ORNL)

Descriptors: *Tritium, *Radioactivity, *Water vapor, *Environment, *Effluents, Fallout, Research and Development, Food chains, Path of pollutants, Grasslands, Grazing, Milk, Ecology, Transfer, Movement, Public health.

Beyond its numerous industrial and scientific applications, tritium draws attention because it is produced in large amounts by the expanding nuclear industry and the major part is released into the environment as tritiated water. In this form, it will move freely in the biosphere, and it may be ingested by man not only in his drinking water but also in his food. Indeed, where tritiated water is

taken up by plants, incorporation of tritium into organic matter will occur during the photosynthetic process. Ingestion of this tritiated material by animals may lead to tritium content higher than expected in organic molecules which are synthesized by an animal. In order to obtain more information on this subject, several experiments have been carried out since 1968 at the experimental farm of the Center of Nuclear Studies in Mol, with financial support by the Public Health Ministry. Some recent results from data of these experiments are presented. (Houser-ORNL)

Identifiers: *Fuel reprocessing, *Cosmic rays.

Tritium was, and is being, produced by natural processes in the atmosphere from the interaction between components of the cosmic ray flux and the nuclei of the atoms of the atmosphere. Before the time of nuclear bomb tests, the total amount of tritium on earth was an equilibrium quantity, in that its global decay rate and global production rate were equal. This equilibrium quantity is now difficult to establish; not enough sampling was performed before the testing of fusion bombs in the atmosphere in the late 1950s and early 60s. However, from a few samples from pre-bomb times, and from estimates of cosmic ray flux and its interactions, it can be estimated that this equilibrium quantity must have been a few kg, possibly up to 8 kg, of tritium. Due to its short half-life, 12 years, only the atmosphere and surface waters may have had measurable tritium concentrations. Between 1954 and 1963 hydrogen bomb testing in the atmosphere released approximately 400 kg of tritium, most of which was injected into the stratosphere. (Houser-ORNL)

ENVIRONMENTAL TRITIUM,
National Environmental Research Center, Las Vegas, Nev.
A. A. Moghissi, and M. W. Carter.
In: Tritium, p 399-405, May 1973. 28 ref. Messenger Graphics, Phoenix, Arizona. Price: $35.00.

Descriptors: *Tritium, *Air pollution, *Water pollution effects, *Soil contamination, *Water pollution sources, Nuclear powerplants, Industrial plants, Radioactivity, Nuclear explosions, Water vapor, Equilibrium, Prediction, Measurement, Assay, Surveys, Monitoring, Surveying instruments, Analytical techniques, Public health.

The Environmental Protection Agency (EPA) and its predecessor organizations have long recognized the importance of tritium in the environment; the research and monitoring efforts in this field have become extensive. Tritium is intimately involved in all biological processes, and since it is also radioactive, the possibility of hazard to humans is present. Tritium in the environment originates from natural and man-made sources. In nature, tritium is produced by the interaction of cosmic rays and components of the atmosphere, while the man-made sources are nuclear reactions involved in either weapons development or peaceful uses. Tritium is a fission product as well as a product of fusion reactions and can be produced by many neutron activation processes. The contribution from power reactors, fuel reprocessing plants, and other nuclear reaction sources is gradually increasing with time. In view of this predicted increase in the environmental tritium concentration, an adequate and efficient surveillance program is desirable. The analytical techniques used in such a program must be economical, rapid and sensitive. Thus, with the initiation of environmental tritium surveillance, the development of methodology was given a high priority. (Houser-ORNL)

GUIDANCE FOR LIMITING ENVIRONMENTAL RELEASES OF TRITIUM,
Oak Ridge National Lab., Tenn.
P. S. Rohwer, M. J. Kelley, and R. S. Booth.
In: Tritium, p 422-430, May 1973. 1 fig, 1 tab, 5 ref. Messenger Graphics, Phoenix, Arizona. Price: $35.00.

Descriptors: *Tritium, *Assay, *Measurement, Toxicity, *Public health, Mathematical models, *Radioactivity, Air pollution effects, Food chains, Water pollution effects, Water pollution sources, Soil contamination.

Release of tritium to the environment may result in radiation doses to man. This may occur through a number of exposure modes, each mode having subordinate exposure pathways of potential importance. An exposure 'mode' is defined as the manner of exposure, e.g., ingestion, and is differentiated from an exposure 'pathway' which is the route of exposure, e.g., pasture-cow-milk-man. Exposure modes of principal importance following an environmental release of tritium are ingestion, inhalation, and immersion in contaminated air. To adequately assess the dose commitment from such a release, the potential contribution from each of these exposure modes must be considered. Dose commitment is considered in the assessment of the long-term effects of the release. Dose commitment is the total dose that an individual will accrue within his lifetime as a result of a given radionuclide intake. The Cumulative Exposure Index (CUEX) concept is being developed to facilitate realistic assessment of the effect of environmental releases of radionuclides. (Houser-ORNL)
W73-14968

TRANSFER OF TRITIUM FROM METHANE TO VEGETATION,
National Environmental Research Center, Las Vegas, Nev.
B. J. Mason, H. W. Hop, and C. L. Miller.
In: Tritium, p 455-461, May 1973. 3 fig, 2 tab, 2 ref. Messenger Graphics, Phoenix, Arizona. Price: $35.00.

Descriptors: *Methane, *Nuclear explosions, *Radioactivity, *Tritium, *Path of pollutant, Air pollution, Water pollution, Soil contamination, Absorption, Water vapor, Hydrogen, Aqueous solutions, Equilibrium, Vegetation, Environmental effects, Natural gas, Secondary recovery (Oil), Food chains, Public health.
Identifiers: *Secondary recovery (Gas).

The detonation of the nuclear explosive during the USAEC's Project Gasbuggy opened the way for utilizing nuclear detonations to develop heretofore inaccessible natural gas resources. Results of analyses of the gas taken from the Gasbuggy cavity indicate that tritium is one of the primary radioactive constituents of the natural gas. A study was designed to obtain information on the transfer of tritium from methane, the primary constituent of the gas, to vegetation. Testing of the production of the Gasbuggy well was done by flaring (burning) the gas for extended periods of time. The primary radioactive byproduct of this operation is tritiated water. In order to provide additional information, a set of treatments similar to those of the methane study was used to give an indication of the transfer of tritium from tritiated water vapor to vegetation. (Houser-ORNL)

THE BEHAVIOR OF TRITIUM IN THE SOIL,
Massachusetts Univ., Amherst. Dept. of Plant and Soil Sciences.
G. L. Stewart.
In: Tritium, p 462-470, May 1973. 1 fig, 1 tab, 14 ref. Messenger Graphics, Phoenix, Arizona. Price: $35.00.

Descriptors: Behavior, *Tritium, *Hydrogen, Radioactivity, Environment, Nuclear energy, Nuclear explosions, Nuclear powerplants, Effluents, *Soil contamination, Water pollution, Water pollution sources, Radioactive tracers, Soils, Groundwater movement, Soil aspects, Path of pollutant, Food chains, Public health.

Soil, hydrologists and other scientists are interested in predicting the rate of water movement through porous media; and, for many kinds of investigations, this can most adequately be accomplished by the use of tracer techniques. Some water tracers are classified as potentially hazardous pollutants and are, therefore, of special interest. Tritium, a radioactive isotope of hydrogen, is being used extensively as a tracer to depict water flow in porous media; and, because it is a product of thermonuclear reactions, it is sometimes considered a pollutant to the environment. Although many investigations have been conducted to determine the behavior and fate of tritium in the environment, there is still a lack of knowledge about its behavior in some natural processes, such as its interaction with soil materials. It is not only important to understand the fate of tritium in natural processes, but it is also important to fully understand its potential as a scientific tool. Listed are reasons for concern about the behavior and interaction of tritium in soils. (Houser-ORNL)

Descriptors: *Tritium, *Effluents, *Nuclear powerplants, *Water vapor, *Soil contamination, Absorption, Soil aspects, Soil water, Ion exchange, Soil physics, Radioisotopes, Soil environment, Waste disposal, Food chains, Public health, Environmental effects.

When tritiated water comes in contact with earth materials, some of the tritium atoms may be retained preferentially (with respect to protium) on the minerals, especially on clays. Several mechanisms of retention are known to occur, or at least are theoretically possible. Some of these are: exchange of tritium ions for hydrogen ions in exchange positions, exchange of tritium ions for exchangeable cations other than hydrogen ions,

tritiated water molecules exchanged for ordinary water of crystallization or hydroxyl water, and replacement of lattice aluminum sites by tritium (the aluminum ions moving into exchange positions). Depending on the process factors (such as mineral species present, pH, ionic exchange capacity, isotope concentration, etc.), one or the other of these mechanisms may predominate. This exchange may cause a transient retardation of the isotope's flow through the soil. If the interaction of soil and isotope is very strong, a more or less permanent fixation of the sorbed isotope may take place. (Houser-ORNL)

DYNAMIC MODEL OF WATER MOVEMENT IN SOIL UNDER VARIOUS CLIMATOLOGICAL CONDITIONS,
Puerto Rico Univ., Mayaguez. Dept. of Nuclear Engineering.
D. S. Sasscer, C. F. Jordan, and J. R. Kline.
In: Tritium, p 485-495, May 1973. 7 fig, 7 ref. Messenger Graphics, Phoenix, Arizona, Price: $35.00.

Descriptors: *Tritium, *Movement, Hydrology, *Model studies, *Ecosystems, *Soil water movement, Soil contamination, Kinetics, Latitudinal studies, Vertical migration, Theoretical analysis, Simulation analysis.

The purpose was to ascertain if a previously developed kinetic equation ecosystem model was sufficiently general to simulate and predict the movement of water (both stable and tritiated) in soil under diverse climatological conditions and, if so, to apply this model to water movement in the soil of a tropical rain forest, an Illinois grassland and a Nevada desert site. The model is called MESA (Multivariable EcoSystem Analysis). The water in the soil is described in the model by 50 simultaneous first order, linear differential equations with discontinuous, variable coefficients. The coefficients are assumed to be functions of the evapotranspiration, soil-water diffusion, gravity flow of soil water, and the previous 48 hours history of rainfall. Soil water had been found in earlier studies to move downward in a pulse due to gravity flow (after a rainfall), to spread out due to diffusion, and to leave the system by evapotranspiration. It was an additional purpose to determine the significance of these parameters as a function of climatic variables. (Houser-ORNL)

LABORATORY SYSTEM FOR TRITIUM ANALYSIS OF LARGE NUMBERS OF ENVIRONMENTAL SAMPLES,
National Environmental Research Center, Las Vegas, Nev.
D. D. Moden, J. W. Mullins, and R. E. Jaquish.
In: Tritium p 512-516. May 1973. 2 fig, 2 ref. Messenger Graphics, Phoenix Arizona, Price: $35.00.

Descriptors: *Tritium, *Analytical techniques, *Sampling, *Assay, Atmosphere, Moisture, Milk, Urine, Vegetation, Soil analysis, Animal metabolism, Natural gas, Data collections, Instrumentation, Measurement, *Pollutant identification.

The Natural Environmental Research Center, Las Vegas, performs tritium analysis on a variety of environmental samples. The laboratory surveillance activities result in the collection and analysis of samples of surface water, atmospheric moisture, milk, urine, vegetation, soil, blood, animal tissue, and natural gas. Techniques were developed for sample preparation and analysis of large numbers of samples. These techniques can be performed routinely by laboratory technicians. Quality control and calibration techniques were incorporated with the counting procedures to assure accuracy and precision of the data. Computer programs were written to perform calculations and generate necessary reports. (Houser-ORNL)

TUMBLEWEED AND CHEATGRASS UPTAKE OF TRANSURANIUM ELEMENTS APPLIED TO SOIL AS ORGANIC ACID COMPLEXES,
Battelle-Pacific Northwest Labs., Richland, Wash. Ecosystems Dept.
K. R. Price.
Available from NTIS, Springfield, Va., as BNWL-1755; $4 in paper copy, $1.45 in microfiche. Report BNWL-1755, May 1973. 13 p, 2 tab, 6 ref

Descriptors: *Absorption, *Nuclear wastes, *Grasses, *Soil contamination effects, Chelation, Soil chemical properties, Soil-water-plant relationships, Washington, *Path of pollutants, Food chains, Organic acids, Waste disposal, Waste treatment, Environmental effects, Biological properties, Physicochemical properties.
Identifiers: *Transuranium elements.

To obtain information relevant to waste management, uptake by plants was compared for addition of transuranics to soil in nitric acid solution and in solutions containing complexing agents such as are used in nuclear-fuel reprocessing (oxalate, citrate, glycolate, or acetate). In all cases the order of decreasing uptake of the transuranics was: Np, Cm/Am, and Pu. The amount of uptake from soil spiked by solutions containing complexing agents relative to that from soil spiked by nitric acid solutions was greater for Np and Pu but less for Am and Cm. (Citrate enhanced Pu uptake 6-fold, but reduced Am uptake 10-fold.) Whether soil or plant mechanisms, or both, are responsible, and effects from varying the pH of the solutions, will be studied in the future. (Bopp-ORNL)
W73-14975

TRITIUM UPTAKE AND LOSS IN GRASS VEGETATION WHEN EXPOSED TO AN ATMOSPHERIC SOURCE OF TRITIATED WATER,
Argonne National Lab., Ill.
J. R. Kline, and M. L. Stewart.
Report available from NTIS, Springfield, Va., as ANL-7960, Part 3; $7.60 in printed copy, $1.45 in microfiche. In: Report ANL-7960, Part 3, p 117-133. Jan.-Dec. 1972. 4 fig, 1 tab.

Descriptors: *Tritium, *Nuclear wastes, *Grasses, Plant physiology, Soil-water-plant relationships, Water vapor, Air pollution, *Path of pollutants, Public health, Fallout, Milk, Pastures, Soil contamination, Soil moisture, Forecasting.

Rates of equilibration of plants with tritiated water vapor were measured under conditions chosen to simulate vegetative contamination from releases of gaseous effluents near the ground. Forecasting of vegetation contamination from effluents is simplified by the finding that the data follow first-order reaction kinetics. Most uptake occurred through the stomata of the leaves, but some occurred through the epidermis of the entire plant. The time required for equilibration with an atmospheric source indicates that milk contamination may be avoided by shifting cattle to an alternate food after a release of short duration. A few hours is required on a sunny day; much longer under rainy, overcast, or cool weather conditions. Under conditions of chronic contamination, tritium in pasture plants increases with increasing soil moisture. (Bopp-ORNL)

PLUTONIUM IN LAKE MICHIGAN WATER,
Argonne National Lab., Ill.
M. A. Wahlgren, and D. M. Nelson.
Report available from NTIS, Springfield, Va., as ANL-7960, Part 3, $7.60 in paper copy, $1.45 in microfiche. In Report ANL-7960, Part 3, p 7-14 Jan.-Dec. 1972. 6 tab, 19 ref

Descriptors: *Lake Michigan, *Fallout, *Nuclear wastes, *Strontium radioisotopes, *Path of pollutants, Sampling, Tritium, Water analysis, Analytical techniques, Radio-ecology, Sedimentation rates, Radioactivity techniques, Mass spectrometry
Identifiers: *Plutonium, Cesium radioisotopes

Comparison of recent and 1971 analyses suggests that plutonium distribution in lacustrine and marine environments is controlled by biological sedimentation or some other mechanism. Data on the Sr90 concentration in 1972 samples are being obtained in order to estimate its inventory in the lake. Data showing that significant concentration gradients do not exist for either Pu239 or Cs137 show that variations (if they are found) in sediment and biota will be significant in correlating other factors such as sedimentation rates or feeding habits. A CaF2 scavenging technique using 50-liter samples was used in determining Pu, Cs137, and Sr90 in lake water. A different (isotope dilution, mass spectrometer) method is being developed for plutonium for which 10- to 100-ml samples are adequate. (Bopp-ORNL)

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF ENRICO FERMI ATOMIC POWER PLANT - UNIT 2.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50341-40. $7.60 per copy, $1.45 microfiche. Docket No. 50341-40; July 1972. 201 p, 12 fig, 20 tab, 48 ref, 11 append.

Descriptors: *Nuclear powerplants, Effluents, *Environmental effects, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Michigan.
Identifiers: *Boiling water reactors, *Environmental impact statements.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed construction of the Enrico Fermi Atomic Power Plant Unit 2. The proposed plant is a boiling-water reactor located near Monroe, Michigan, cooled by wet, natural draft cooling towers and with make-up water from Lake Erie. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. It is concluded that a construction permit should be issued for this plant subject to the following conditions for protection of the environment: (1) mitigate or alleviate adverse environmental effects from quarrying and construction of transmission lines; (2) establish preoperational base-line data on aquatic species; (3) establish preoperational effluent monitoring programs and a program continuing through operation; (4) establish radiological monitoring to determine effects on the environment; (5) provide a course of action to alleviate detrimental effects. (Houser-ORNL)
W73-14979

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF DUANE ARNOLD ENERGY CENTER.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50331-87. $10.60 per copy, $1.45 in microfiche. Docket No. 50331-87, March 1973. 333 p, 33 fig, 59 tab, 130 ref, 10 append.

Descriptors: *Nuclear powerplants, Effluents, *Environmental effects, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Iowa.
Identifiers: *Boiling water reactors, *Cedar River (Iowa), *Environmental Impact Statements.

The final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed continuation of construction of the Duane Arnold Energy Center, a boiling water reactor cooled by a closed-cycle system using forced-draft cooling towers and located at Fayette Township, Iowa. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. It is concluded to continue the construction permit and issue an operating license subject to some restrictions of chlorine concentrations and effects, iodine releases, and certain radiological and environmentalmonitoring programs to be continued as specified. (Houser-ORNL)

ECOLOGICAL INVESTIGATION OF RADIOACTIVE MATERIALS IN WASTE DISCHARGE AREAS AT LOS ALAMOS FOR THE PERIOD JULY 1, 1972 - MARCH 31, 1973,
Los Alamos Scientific Lab., N. Mex.
T. E. Hakonson, J. W. Nyhan, L. J. Johnson, and K. Y. Bostick.
Available from NTIS, Springfield, Va., as LA-5282-MS; $4 in paper copy; $1.45 in microfiche. Report LA-5282-MS, May 1973. 47 p, 17 fig, 17 tab, 56 ref.

Descriptors: *Nuclear wastes, *New Mexico, Effluents, *Semiarid climates, Terrestrial habitats, Insects, Food webs, Path of pollutants, Tritium, Nuclear explosions, *Waste disposal, Ecosystem, Vegetation, Rodents.
Identifiers: *Cesium radioisotopes, *Plutonium.

Liquid-waste-disposal-area history is summarized, including accumulative Pu. Most biota (vegetation, rodents, deer, coyotes, and two species of birds) had tritium less than the effluent water; however, honeybees from certain hives had as much as two orders of magnitude higher levels, apparently from the foraging of the bees on clover growing near disposal pits of high-tritium wastes. There was also evidence of uptake of Cs137 and Pu by biota in an area within about 2500 meters of the waste outfalls; however, most Cs137 remained in stream channel alluvium. The role of effluent pH in mediating Cs137 and Pu transport will be studied. Physical and breeding characteristics of 110 rodent species are summarized. Radionuclides are being determined in soils and biota in the vicinity of the 1945 Trinity shot near Alamagordo, New Mexico. (Bopp-ORNL)

ROLE OF ORGANIC MATERIALS IN A WATER COURSE WITH RESPECT TO RADIOACTIVE CONTAMINATION. METHOD OF EXTRACTION, FRACTIONATION AND IDENTIFICATION BY SPECTROSCOPY AND THEIR AFFINITY TO RADIONUCLIDES,
Commissariat a l'Energie Atomique, Cadarache (France). Centre d'Etudes Nucleaires.
J. Faure.
Available from NTIS Springfield, Va., as ANL-Trans-943; $4 in paper copy, $1.45 in microfiche. Report ANL-TRANS-943, May 1973. 51 ref. (Trans. from CEA-R-4335 Report, August 1972).

Descriptors: *Sediments, Rivers, *Organic soils, *Nuclear wastes, Absorption, *Path of pollutants, Physicochemical properties, Separation techniques, Analytical techniques, Chemical degradation, Oxidation, *organic matter, Humic acids, Organic compounds, Chelation, Spectrophotometry, Molecular structure, Soil contamination, Soil chemical properties, Soil analysis, Trace elements.
Identifiers: *France (Rhone River).

Organic substances that absorb radionuclides in Rhone River sediments were characterized as carbonyl-containing derivatives of polycylic hydrocarbons and porphyrins. The organic matter was separated from sediment by extraction with 0.1 N NaOH or with ion-exchange resin. (In later work described in CEA-R-4443, March 1973, it was shown that the use of 0.01 NaOH produced less degradation.) Organic compounds were separated by gel-filtration chromatography and thin-layer chromatography and were identified by ultraviolet spectroscopy. The 19 figures and 9 tables of the original document are not included in this translation. (Bopp-ORNL)

INDIRECT RADIOACTIVE CONTAMINATION OF THE FOOD CHAIN. DETERMINATION OF THE FACTORS OF TRANSFER, SOIL/AGRICULTURAL PRODUCE, SOIL/MILK, IN THE EUROPEAN COMMUNITY,
Commissariat a l'Energie Atomique, Fontenay-aux-Roses (France).
J. Lehr.
Available from NTIS, Springfield, Va., as EUR 4901e; $4 in paper copy, $1.45 in microfiche. Report EUR 4901e, 1972. 42 p, 5 fig, 13 tab, 6 ref.

Descriptors: *Strontium radioisotopes, *Fallout, *Crops, *Food chains, Milk, Vegetable crops, Fruit crops, Forages, Cereal crops, Absorption, Path of pollutants, Soil contamination, Soil properties, Soil-water-plant relationships, Potassium, Europe, Soil moisture, Soil contamination effects.
Identifiers: *Cesium radioisotopes.

Data on the 1966-1967 Sr90 content of various crops are correlated. To reduce the dependence on the Ca content of the soil, a parameter termed the O.R. (ratio of Sr90 to Ca in produce)/ (ratio of Sr90 to Ca in soil) is used. Uptake was higher by rye which is cultivated on acid soils, than by other grains, and was higher by potatoes than by carrots and beets. Data are also given for fodder crops, milk, lettuce, cabbage, tomatoes, and apples. Poor correspondence with laboratory experiments showed that other factors were important in addition to those studied. Possible reasons are given for the O.R. being about twofold greater for calcareous than for other soils. Cs137 uptake from direct deposition on the plant generally is more important, but uptake through the soil is increased under the combined conditions of a humic sandy soil, deficiency in K, and a wet climate. Cs137 in fodder crops was highest in spring and appeared to correlate with soil moisture. (Bopp-ORNL)

A STUDY OF THE DISTRIBUTION OF POLYCHLORINATED BIPHENYLS IN THE AQUATIC ENVIRONMENT,
Geological Survey, Washington, D.C.
H. J. Crump-Wiesner, H. R. Feltz, and M. L. Yates.
Journal available from Sup Doc, GPO, Washington, D.C. 20402 Price $2.75. Journal of Research of the U.S. Geological Survey, Vol 1, No 5, p 603-607, September-October 1973. 2 fig, 4 tab, 12 ref.

Descriptors: *Polychlorinated biphenyls, *Water pollution sources, Pollutant identification, Pollutants, Surface waters, *Industrial wastes, Data collections, Pesticide residues.

Data gathered from monitoring activities and project studies show the occurrence and distribution of polychlorinated biphenyls in the aquatic environment. Residues were detected in samples from 19 States, representing nearly every region of the country. Concentrations ranged from 0.1 to 4.0 micrograms per liter in unfiltered water samples and 5.0 to 3,200 micrograms per kg in bottom sediments. PCB residues were also found in fish and aquatic plants. Samples were prepared by the same techniques used for general chlorinated insecticide detection, with special attential to cleanup and separation of PCB's from other compounds. Basic identification and quantification were made by dual-column electron-capture gas chromatography and confirmed by gas chromatography-mass spectrometry whenever possible. (Knapp-USGS)

FUNDAMENTAL PROBLEMS OF GROUNDWATER CONSERVATION (OSNOVNYYE PROBLEMY OKHRANY PODZEMNYKH VOD),
Akademiya Nauk SSSR, Moscow. Institut Vodnykh Problem.
Ye. L. Minkin.
Vodnyye Resursy, No 2, p 64-82, 1972. 2 fig, 2 tab, 9 ref.

Descriptors: *Groundwater, *Water conservation, *Water pollution control, *Water quality control, Water pollution sources, Pollutant identification, *Path of pollutants, Groundwater mining, Withdrawal, Exploitation, Safe yield, Aquifers, Wells, Forecasting, Equations.
Identifiers: USSR.

Two basic directions in the conservation of groundwater are examined: (1) protection of groundwater from depletion; and (2) protection of groundwater from bacterial and chemical contamination. Recommendations are developed for needed studies and forecast computations to justify groundwater conservation. Basic measures are outlined to prevent groundwater depletion and contamination and to eliminate or localize existing pollution. Depending on specific conditions, measures to eliminate or localize pollution are classified into 3 categories: (1) creation of barriers to the path of movement of contaminated water toward wells; (2) reduction in well discharge; and (3) elimination of sources of pollution and pathways by which pollutants enter groundwater.

Elimination of the pollution sources in groundwater involves great expenditure of time and labor. (Josefson-USGS)

Identifiers: *Bioaccumulation, *Selenium, Selenite, Selenomethionine, Fate of pollutants, Animal tissues, Se-85, Punti, Scenedesmus dimorphus, Daphnia pulex, Reed grass, Roach, Northern pike, Cod (Fish), Burbot, Flounder, Whales, Seals (Animals) Rosefish, Starry flounder, Whitefish, Ocean perch, Breams, Pollack, Coalfish.

Fish muscle samples, plankton, aquatic plants, and meat meals were analyzed for the presence of selenium. The method of Lindberg (1968) was used in which 2,3-diaminonaphthaline is used as a fluorescing reagent and the recovery of Se is measured using Se-75 as a tracer. Cultured Scenedesmus dimorphus were used to study the transfer of Se from selenite and selenomethionine from water to phytoplankton. In some cases metabolic inhibitors (iodoacetamide, l-methionine, KCN, l-ethionine, 2,4-dinitrophenol) were used. The transfer of Se from selenite and selenomethionine to fishes was studied in aquaria. Phytoplankton which had taken up Se-75 were fed to zooplankton and finally the fish Puntius arulius. The Se content was lowest in aquatic plants, varying from 0.02 to 0.14 ppm (dry wt). Plankton samples contained from 1.1 to 2.4 ppm, fishes cultured in ponds 0.5 to 0.9 ppm, and fishes from natural environments 1.0 to 2.9 ppm. The phytoplankter, Scenedesmus dimorphus, actively concentrated Se-selenomethionine, but neither actively nor passively concentrated inorganic selenite. The zooplankton, consisting mostly of Daphnia pulex, absorbed Se from selenite. In aquariums fish concentrated only a small amount of organic or inorganic Se directly from water, but did concentrate Se from food. (Holoman-Battelle)

THE LIGHT DEPENDENCE OF NITRATE REDUCTASE IN MARINE PHYTOPLANKTON,
Washington Univ., Seattle. Dept. of Oceanography.
T. T. Packard.
Limnology and Oceanography, Vol 18, No 3, p 466-469, May 1973. 1 fig, 2 tab, 16 ref.

Descriptors: *Bioassay, *Phytoplankton, *Light intensity, *Limiting factors, Enzymes, Nitrates, Phosphates, Silicates, Nutrients, Sea water, Marine plants.
Identifiers: *Nitrate reductase, Africa (Mauritanean sector).

Experiments were designed to determine the light dependence of nitrate reductase (NR) in natural marine phytoplankton populations. The studies were conducted in the Mauritanean sector of the NW African upwelling system during March - April 1970. Seawater rich in both phytoplankton and inorganic macronutrients (NO3 (minus), PO4 (3 minus), and Si04 (4 minus)) was collected before dawn with a large volume nontoxic sampler and transferred to 4-liter Pyrex bottles. Each bottle was covered by a nickel screen designed to simulate the in situ light intensity at the depths to which 100, 50, 25, 10, and 1 percent of the surface light penetrated. A dark bottle provided a control. The bottles were incubated at sea-surface temperature (17 C) and natural sunlight until noon. The samples were then analyzed for NR activity. The light dependence of assimilatory nitrate reductase in marine photoplankton was shown to follow a rectangular hyperbola. Analysis by the Michaelis-Menten equation yielded values of K sub Lt ranging from 0.002 to 0.037 langleys per min. indicating that the light requirements of phytoplankton are satisfied at low light intensities. IN VITRO HYDROLOYSIS OF POLYOXYETHYLENE ESTERS BY TISSUES OF THE AMERICAN EEL AND ATLANTIC SALMON,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
D. J. Wildish, and D. Beatty.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 4, p 212-217, April 1973. 3 tab, 1 fig, 5 ref.

Descriptors: *Atlantic salmon, *Toxicity, *Hydrolysis, Water pollution effects, Marine fish, Enzymes, Biodegradation, Volumetric analysis.
Identifiers: *Oil dispersants, *Polyoxyethylene esters, *Detocification, Biological samples, Tissue, *American eel, Polyoxyethylene ethers, Pegosperse 200 ML, Pegosperse L-9, Hallco CPH-43, Kessco TM, Varionic Polyglycol esters 400 MO, Ethosperse LA-4, Sample preparation, Liver, Blood, Esterase.

Tissue samples from parr and post-smolts of Atlantic salmon (Salmo salar) and American eel (Anguilla rostrata) were homogenized, washed, acetone-dried, and pulverized for use in determining their ability to hydrolyze polyoxyethylene (POE) esters. Blood serum was prepared for the tests by centrifugation. Six POE esters which are commonly used as oil dispersants, were investigated: POE (4) monolaurate, POE (9) monolaurate, POE (14) monolaurate, POW (14) dilaurate, POE (9) mono-oleate, and POE (4) lauryl ether. Activity of esterase was determined by continuous titration of product acid with NaOH. Reaction velocity was also determined. The livers of Atlantic salmon and American eel were able to hydrolyze POE esters at rates which depended on POE chain length. Increased chain length decreased hydrolysis rate. It is concluded that if hydrolysis of these compounds by tissues detroxifies them, eels should be less susceptible than salmon since they hydrolyze the compounds more rapidly than salmon. Identifiers: *Clophen A 50, Transport, GC-mass spectrometry, Chemostat, Biotransformation, Chlorella, Pyrenoidosa, Leucaspius delineatus, p p'-DDE, p p'-DDT, Perca fluviatilus, Planorbis corneus, Lebistes reticulatus, Esox lucius, p p'-DDD, Mass spectra, Dechlorination, Bioaccumulation, Biological samples, Macroinvertebrates.

Transport, distribution, and degradation of Clophen A 50Ca commercial mixture of PCB, p,p'-DDE, and p,p'-DDT were investigated in laboratory-model ecosystems containing a green alga (Chlorella pyrenoidosa), a cyprinid (Leucaspius delineatus), a mollusk (Planorbis corneus), and fish (Esox lucius, Perca flavescens, Lebistes reticulatus) in various combinations. The model system consisted of a primary producer unit (a continuous-flow culture or chemostat) connected to separate compartments in which consumer organisms were kept. Effluent from the chemostat containing known concentration of cells and test substance was directed to different compartments. The test substance was taken up by feeding on

al cells, by sorption, or by a combination of se. Samples of air, water, and organisms in the tem were analyzed for residues by gas chro-tography and GC-mass spectrometry. (1) The stances tested were mainly taken up by lorella pyrenoidosa and only small fractions re recovered in the water and air of the systems. Transport of the test substances to the first sumer organisms (Leucaspius delineatus) was inly accomplished by the algae. (3) Molecules h low chlorine content in Clophen A 50 were raded when transported through the food in. (4) No major metabolic changes of p,p'-DE occurred during transport through the food in. (5) The producer organisms were not able to rade p,p'-DDT. At the primary and secondary sumer levels, p,p'-DDT was partly chlorinated to p,pl-DDE and p,p'-DDD. (Little-ttelle)

entifiers: Sorting, Hydropsyche sparna, Cheu-topsyche oxa, Chimarra aterrima, Macroinver-brates, *Eramosa River, Sample preparation, rvival, Trichoptera, Net size, Substrates.

et-spinning caddisflies in the Eramosa River, ntario were studied to investigate the effect of vironmental factors on the organisms, and to udy their feeding habits, nets, and life cycles. A rber-type square foot sampler was used to col-ct about ten samples per month. Samples were eserved with formalin, taken to the laboratory, ashed, drained and placed in a glass pitcher to hich calcium chloride and paraffin oil was added. pon stirring, the insects remained in the oil hich was poured off through a fine net. The three ost common species of caddisflies were picked om the floated material under a dissecting icroscope. These were Hydropsyche sparna, heumatopsyche oxa, and Chimarra aterrima. uspended matter was measured in the field. Mid-it contents of larvae were filtered and counted. ocks were collected six times and analyzed for ydropsychid nets, net size and net mesh. Life cy-es were determined using all the larvae and upae collected monthly. The survival of C. ater-ma was studied in the laboratory under varied onditions. Larvae of the three species were found prefer shallow, fast-flowing sites with large, oss-covered rocks. Several seasonal and inter-pecific differences were revealed. A hilopotamid species was found to occupy a dif-erent niche from two hydropsychid species, hiefly in terms of food and feeding, but no major cological differences could be demonstrated etween the last-mentioned species-pair. WAX ESTERS IN TROPICAL ZOOPLANKTON AND NEKTON AND THE GEOGRAPHICAL DISTRIBUTION OF WAX ESTERS IN MARINE COPEPODS,
Scripps Institution of Oceanography, La Jolla, Calif.
R. F. Lee, and J. Hirota.
Limnology and Oceanography, Vol 18, No 2, p 227-239, March 1973. 7 tab, 35 ref.

Descriptors: *Zooplankton, *Nekton, *Copepods, Marine animals, *Ecological distribution, *Tropical regions, Pacific Ocean, Crustaceans, Lipids, Organic compounds, Marine fish, Chemical analysis, Invertebrates, Mollusks.
Identifiers: *Esters, *Wax, Squid, Chaetognaths, Decapods, Pelagic animals, Macroinvertebrates, Mysids, Gnathopausia, Euphausiids, Myctophidae, Chirundina streetsi, Euchirella brevis, Euchirella galeata, Euaugaptilus, Bathycalanus richardi, Calanus gracilis, Megacalanus longicornis, Calanus minor, Candacia aethiopica, Euchaeta marina, Paraeuchaeta, Valdiviella insignis, Eucalanus, Hemirhabdus grimaldi, Heterorhabdus, Mesorhabdus.

Analyses of zooplankton and nekton from the central South Pacific showed that surface and epipelagic zooplankton had small amounts of neutral lipids, mainly triglycerides, while deep-water tropical copepods had wax esters as the major lipid type, presumed to function as a reserve storage. The total lipid content and wax esters of tropical copepods captured at about 500 m were significantly lower than those of species from high latitudes. The median percentage of wax esters increased progressively from tropical to polar latitudes in nine species of Calanus and five or six species of Euchaeta. Deep-living tropical copepods had the same median percentage of wax esters as mesopelagic and bathpelagic copepods from a subtropical station. Caridean and penaeidean decapods and euphausiids showed less than 5 percent wax esters. Gnathophausia, a mesopelagic mysid, stored wax esters (32 percent of the lipid). A deep-water chaetognath (Eukrohnia sp.) and a mesopelagic cranchiid squid had over 25 percent wax esters. Fish species not previously analyzed containing more than 10 percent wax esters included three myctophids and members of the Astronesthidae, Cheilodipteridae, Gonostomatidae, Paralepididae, Scopelosauridae, and Sternoptychidae. THE OCCURRENCE AND DISTRIBUTION OF SOME AQUATIC PHYCOMYCETES ON ROSS ISLAND AND THE DRY VALLEYS OF VICTORIA LAND, ANTARCTICA,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
R. A. Paterson.
Mycologia, Vol 65, No 2, p 373-387, March/April 1973. 25 fig, 12 ref.

Descriptors: *Aquatic fungi, *Ecological distribution, *Antarctic, *Isolation, Algae, Soil environment, Aquatic environment, Cultures, Sampling, Diatoms, Pollen, Cold regions.
Identifiers: *Phycomycetes, Oomycetes, *Ross Island, *Victoria land, Sample preparation, Chytrids, Scherffeliomyces appendiculatus, Chytridium versatile, Rhizophlyctis rosea, Rhizophydium proliferum, Phlyctochytrium recurvastomum, Catenophlyctis variabilis, Pythium tenue.

Water, soil, and alga samples collected on Ross Island and the dry valleys of Victoria Land during January and February, 1971, were found to contain monocentric chytridiaceous fungi, a blastocladiaceous fungus, and filamentous Oomycetes. Of the alga-infesting chytrids, only Scherffeliomyces appendiculatus and Chytridium versatile could be identified with certainty. Saprophytic chytrids which grew on baits were represented by Rhizophlyctis rosea, and two new species, Rhizophydium proliferum and Phlyctochytrium recurvastomum. Catenophlyctis variabilis occurred as a saprophyte of keratinous substrata. The Oomycetes were represented by Pythium tenue and an undetermined sterile species of Pythium. Aside from univerified observations of Aphanomyces, members of the Saprolegniaceae were lacking. The low diversity of aquatic Phycomycetes with frequent reoccurrence of a few species is noted and commented upon. (Holoman-Battelle)

MERCURY IN SEALS FROM EASTERN CANADA,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
D. E. Sergeant, and F. A. J. Armstrong.
Journal of the Fisheries Research Board of Canada, Vol 30, No 6, p 843-846, June 1973. 2 tab, 8 ref.

Descriptors: *Mercury, *Canada, Chemical analysis, Food habits, Pollutant identification, Ecological distribution, Migration patterns, Heavy metals, Marine animals, Food webs, Food chains.
Identifiers: *Bioaccumulation, *Harp seals, *Grey seals, *Harbor seals, *Hood seals, Animal tissues, Seals (Animals), Liver, Heart, Intestine, Lungs, Pagophilus groenlandicus, Halichoerus grypus, Phoca vitulina, Cystophora cristata, Biological magnification, Atomic absorption spectrophotometry.

Mercury concentrations were measured in four species of seals having different migratory patterns and feeding ecology in order to clarify to some extent the distribution of mercury in the ocean and concentrations through the food chain. Portions of 0.1-0.5-g tissue were analyzed by the low-temperature acid digestion and atomic absorption method of Armstrong and Uthe (1971). Mercury concentrations were highest in liver (usually 1-100 ppm) but up to 387 ppm and lowest in blubber (usually 0.1 ppm). Levels in muscle ranged from less than 0.16 to 2.35 ppm. Values similar to those in muscle were found in the few specimens of heart, intestine, and lungs analyzed, and higher values in kidney and hair. Ratios of mercury in the liver to that in the muscle for adult seals were much greater than those found in two species of freshwater fish and three species of domestic animals exposed to wide ranges of mercury concentrations in their food. Mercury in seals increased with age and appeared to vary with the position in the marine food web of the organisms which they eat. Harp seals (Pagophilus groenlandicus), which feed on small pelagic fish and crustaceans, accumulated an order of magnitude less mercury than grey (Halichoerus grypus) and harbour (Phoca vitulina) seals, which live on large pelagic and benthic fish and cephalopods. However, grey and harbour seals are resident in eastern Canadian waters, which presumably contain

higher mercury levels than arctic waters, where harp seals spend about half the year. Yet hood seals (Cystophora cristata), which spent more than half the year in arctic waters but feed on large fish and cephalopods, had mercury levels as high as grey and harbour seals. (Holoman-Battelle)

BIODEGRADATION OF OLEATES,
Veterans Administration Hospital, Houston, Tex.
J. Williams, and E. O. Bennett.
Jouranl Water Pollution Control Federation, Vol 45, No 8, p 1671-1681, August 1973. 7 fig, 2 tab, 36 ref.

Descriptors: *Microbial degradation, *Cultures, *Growth rates, Path of pollutants, Carbon.
Identifiers: *Pseudomonas aeruginosa, *Oleates, Biodegradability, Sodium oleate C, Morpholine oleate, Copper oleate, Magnesium oleate.

Because of the wide variety of man-made oleates being used in industry, tests were conducted to determine the biodegradability of a number of commercial compounds. The compounds studied were metal oleates, glycol oleates, glyceraol oleates, butyl, morpholine, methyl, triethanolamine oleates, and methyl hydroxyoleate. Pseudomonas aeruginosa cultures were prepared for the tests by growing on nutrient agar and resuspending in saline solution. The inoculum was placed in a flask containing mineral salts basal medium and a specified concentration of a particular fatty acid salt as the sole carbon source. Biodegradability was determined by the rate of growth of the bacteria in oleate medium and in a control medium. Sodium oleate which is known to be biodegradable served as a reference. The results indicate that the degree and rate of degradation of oleic and hydroxyoleic acids are affected by purity of the substrate, number or position of oleate substituents, presence of metallic substances, and concentration of the substrate. HYPOTHALAMIC TEMPERATURE REGULATION IN CATTLE,
Texas A and M Univ., College Station.
R. E. Stewart, and E. M. Bailey, Jr.
Paper No 72-511 presented at 1972 Annual Meeting, American Society of Agricultural Engineers, Hot Springs, Arkansas, June 27-30, 1972, 20 p, 10 fig, 2 tab, 9 ref.

Descriptors: *Cattle, *Temperature control, Humidity.
Identifiers: *Hypothalmus, *Craniotomy, Cannulae, Respiration rate, Thermal environment, Hypothalmic heating, Rectal temperature, *Hypothalmic temperature.

It was theorized that routine access to the hypothalamus by the means of indwelling cannulae would allow rapid testing of efficiency in control of body temperature of cattle. A semi-stereotaxic method for cannulae installation was developed. The heat loss center of two female beef calves was heated by RF energy; some degree of correlation was observed between hypothalamic temperature and respiration rate. Animals were subjected to a step change in thermal environment (75 degrees to 95 degrees with very high humidity); rectal and hypothalamic temperatures were found to be coupled by the respiration rate, with marked individual differences. The approach appears to have merit as a system for rapid indentification of heat tolerant breeds and individuals. (Wetherill-East Central)

CORRELATING OIL AND ODOROUS COMPONENTS IN STORED DAIRY MANURE,
Clemson Univ., S.C.
C. L. Barth, D. T. Hill, and L. B. Polkowski.
Paper No 72-950 presented at 1972 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 11-15, 1972; Order No. M172-950, 17 p, 9 fig, 2 tab, 24 ref.

Descriptors: *Odor, *Chemical properties, Physical properties, Air pollution, Dairy industry, *Farm wastes, Cattle, Waste storage, Ammonia, Hydrogen sulfide, Hydrogen ion concentration.
Identifiers: *Odor intensity index, Liquified waste management, Odorants, Volatile organic acid, Acetic acid.

Three common odorants were identified and measured in stored dairy manure. A panel was selected to judge these odors which were present in only one of three flasks per set. The odorous flasks represented various degrees of aeration treatment. Results showed that odorous components derived from lower aeration depths were the most difficult to distinguish. An odor intensity index (OII) was established from the experimental results. Volatile organic acid correlated best with the OII. Second best was hydrogen sulfide and poorest was ammonia. PRINCIPLES OF FEEDLOT ODOR CONTROL.
Texas Agricultural Extension Service, College Station
J. M. Sweeten.
December 1, 1972, 8 p, 4 ref.

Descriptors: *Air pollution, *Feed lots, *Farm wastes, Aerobic bacteria, Moisture contents, Temperature, Waste treatment, Poultry, Lagoons, Waste disposal.
Identifiers: *Odor control, Odor measurement, Odor intensity, Odor quality.

The major obstacle to developing effective odor control techniques, writing quidelines for feedlot odor control, and litigation of feedlot odor cases is the lack of suitable quantitative methods for measuring the intensity and quality of odors. Measuring odor intensity is usually done by diluting with odor-free water; however, measurement of odor quality is difficult because of the lack of an accepted standard. The physical variables which affect the generation of malodors from manure are temperature and moisture content. Experiments with poultry manure have shown that manure odor intensities are proportional to moisture content. This has suggested two approaches to odor control of feedlots- (1) maintenance of aerobic conditions for decomposition, and (2) the chemical treatment of manure. Judicious site selection of feedlots with respect to surrounding land use patterns and climatic factors is a third alternative which has had some success. (Dudley-East Central)
W73-15181

CHROMIC OXIDE AND CRUDE PROTEIN EXCRETION IN THE BOVINE AS INFLUENCED BY WATER RESTRICTION,
Kentucky Univ., Lexington.
D. L. Cross, J. A. Boling, and N. W. Bradley.
Journal of Animal Science, Vol 36, No 5, p 982-985, May, 1973, 2 fig, 4 tab, 12 ref.

Descriptors: *Farm wastes, *Proteins, *Cattle, Metabolism.
Identifiers: *Chromic oxide, *Water restriction, Dry matter digestibility, Fecal dry matter.

Twelve yearling Angus steers were assigned to two periods and two treatments in an experiment designed to study the effect of water restriction on the excretion of chromic oxide and crude protein. Each steer was confined to a metabolism crate and received 4 kg. of a ration plus water free choice of 60% free choice daily. During each period, fecal samples were taken at 2 hour intervals for 48 hours followed by a 7 day total collection of feces. The percent recovery of chromic oxide averaged 103.1 and 102.3 respectively for the steers offered water free choice or 60% of free choice. There was an increase in dry matter digestibility and chromic oxide concentration in fecal dry matter when water was restricted Water restriction did not affect crude protein concentration of fecal dry matter. These data suggest that water restriction has little effect on the excretion of chromic oxide and crude protein. (Marquard-East Central)

ON SPENT SEMICHEMICAL PULPING LIQUORS. (I). SPECIES VARIATION OF PULPING TIMBERS COLOR AND CHEMICAL OXYGEN DEMAND, (IN JAPANESE),
Kyushu Univ., Fukuoka (Japan). Wood Chemistry Lab.
R. Kondo, K. Sameshima, and T. Kondo.
Japan Tappi, Vol 26, No 8, p 401-408, Aug 1972, 12 fig, 3 tab, 6 ref. (English summary).

Descriptors: *Sulfite liquors, *Pulp wastes, *Color, *Chemical oxygen demand, *Hardwood, *Softwood, Deciduous trees, Coniferous trees, Foreign research, Specific gravity, Density, Effluents, Pulp and paper industry, Liquid wastes, Industrial wastes, Waste water (Pollution), Hydrogen ion concentration, Wood wastes, Bark.
Identifiers: *Pulpwood, Tropical plants, Tropical trees, Sulfite pulping, NSSC pulping, Japan, Wood, Wood properties, Black liquor, Spent pulping liquors, Spent NSSC liquor, Pulp yield.

Differences in the color and COD of spent NSSC (neutral sulfite semichemical) pulping liquors were examined as a function of pulpwood species, including Japanese and tropical hardwoods, such as Castanopsis cuspidata, Actinodaphne lancifolia, and species of Carpinus, Shorea, Pentacme, and Dryobalanops, either pulped singly or in various mixtures. Although considerable differences in the spent liquor color were noted, depending on the wood species, there were no great differences in COD. The volume of spent cooking liquor was proportional to the apparent specific gravity of the wood. This gave rise to differences in the distribution of total solids, color, and COD among the liquid effluents isolated at different stages of cooking, pulp washing, and defibration (fiber liberation). The color and COD from lauan species (Shorea and Pentacme), for example, originated mainly from the black liquor. Among all wood species examined, black liquor contributed at most 50% of the total effluent color and COD. With increased black liqur pH, both the effluent color and the pulp yield increased for Japanese hardwoods, but not for tropical species (Shorea, Pentacme, and Dryobalanops). At a given pulp yield, the maximum cooking temperature had no effect on effluent color and COD. Removal of bark reduced the color but raised the COD of effluents. (Brown-IPC)

PACIFIC NORTHWEST LABORATORY ANNUAL REPORT FOR 1972. VOLUME II: PHYSICAL SCIENCES, PART 1. ATMOSPHERIC SCIENCES,
Battelle-Pacific Northwest Labs., Richland, Wash. Atmospheric Sciences Program.
C. L. Simpson.
Available from NTIS, Springfield, Va., as BNWL-1751, Vol. II, Pt. 1; $7.60 in paper copy, $1.45 in microfiche. Report BNWL-1751, Vol. II, Part I, April 1973. 152 p.

Descriptors: *Air pollution, *Fallout, *Precipitation (Atmospheric), *Soil contamination, Effluents, Nuclear wastes, Path of pollutants, Aerosols, Smog, Aircraft, Application equipment, Nuclear powerplants, Nuclear explosions, Tracers, Diffusion, Meteorologic data, Forecasting, Mathematical models, Tritium, Public health.
Identifiers: *Plutonium, Scavenging.

Pu sampling data and meteorological data from Rocky Flats, Colorado, were used to identify significant factors regarding resuspension of Pu-contaminated soil. Capabilities were developed for research aircraft for generation of tracers in studies of scavenging and for measurement of aerosols downwind of urban areas. Work in defining and explaining radionuclide distributions from specific nuclear-testing events is continuing and is being extended to include effluents from nuclear power plants. Diffusion, deposition, and turbulence models (including near-calm wind) were applied to various terrains. Experiments were conducted to provide data for modeling particle deposition and wet scavenging. (Bopp-ORNL)

SOURCES OF TRITIUM AND ITS BEHAVIOR UPON RELEASE TO THE ENVIRONMENT,
Oak Ridge National Lab., Tenn.
D. G. Jacobs.
Available from NTIS, Springfield, Va., as TID-24635; $5.45 per paper copy, $1.45 microfiche. Report No TID-24635, 1968. 96 p, 4 fig, 9 tab, 370 ref.

Descriptors: *Tritium, *Effluents, *Nuclear powerplants, Monitoring, Behavior, Environment, Ecology, Water pollution, Water pollution sources, Assay, Absorption, Biological uptake, Biological membranes, Public health.

This report is the first in the AEC Critical Review Series, a series of state-of-the-art studies prepared for the Atomic Energy Commission. Published information on tritium production and the pertinent factors that affect the behavior of tritium in the environment are reviewed. Because of the extremely large number of publications dealing with tritium, the review is not exhaustive; however, the most important aspects have been mentioned and extensive references are given. Estimates are made for production and accumulation of tritium in an expanding nuclear power economy, including the impact of an increased tritium production on local and worldwide populations. Monitoring practices and instruments for the detection and assay tritium are given. The behavior of tritium in the environment, including the stratosphere, troposphere, deposition on the ground surface, and releases to surface waters and groundwaters, is examined. (Houser-ORNL)

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF VIRGIL C. SUMMER NUCLEAR STATION UNIT 1.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Document 50395-36, $5.45 per copy, $1.45 microfiche. Document No. 50395-36, Jan. 1973. 292 p, 30 fig, 38 tab, 118 ref, 3 append.

Descriptors: *Nuclear powerplants, Effluents, *Environmental effects, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Plankton, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *South Carolina, Lakes, Iodine radioisotopes.
Identifiers: *Pressurized water reactor, Monticello Reservoir, *Environmental Impact Statements.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed construction of the Virgil C. Summer Nuclear Station Unit 1 located near Parr, South Carolina. This station will use a pressurized water reactor. The exhaust steam will be cooled and condensed by once-through flow of water from Monticello Reservoir. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Some of the environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. It is concluded that a construction permit should be issued for the facility subject to the following conditions: (1) make preoperational measurements for a baseline upon which to evaluate possible adverse effects; (2) propose a plan for an operational environmental monitoring program; (3) construct transmission lines in accordance with federal guidelines; (4) follow appropriate guide lines for sanitation in recreational areas; and (5) maintain radioiodine concentration to specified levels. (Houser-ORNL)
W73-15235

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF QUAD-CITIES NUCLEAR POWER STATION UNITS 1 AND 2.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Document No. 50254-120, $10.60 per copy, $1.45 microfiche. Document No. 50254-120, Sept. 1972. 341 p, 14 fig, 25 tab, 152 ref, 3 append.

Descriptors: *Nuclear powerplants, Effluents, *Environmental effects, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Illinois, Mississippi River.
Identifiers: *Boiling water reactors, *Environmental Impact Statements.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the operation of the Quad-Cities Nuclear Power Station Units 1 and 2, near Cordova, Illinois. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Some of the environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The exhaust steam will be cooled by once-through condenser cooling water from the Mississippi River with a diffuser-pipe discharge until a spray-canal cooling system is completed. It is concluded to continue the facility operating license subject to the following conditions: (1) define a monitoring program to determine changes in the ecosystems; (2) define a radiological monitoring program to determine radiological effects of operation; (3) provide certain reports describing results of the environmental monitoring program; and (4) propose technical specification changes prior to operation of the spray-canal cooling system. (Houser-ORNL)
W73-15236

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF COOPER NUCLEAR STATION.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Document No. 50298-69, $7.60 per copy, $1.45 microfiche. Document No. 50298-69, February 1973. 263 p, 22 fig, 39 tab, 91 ref, 3 append.

Descriptors: *Nuclear powerplants, Effluents, *Environmental effects, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Missouri River, *Nebraska.
Identifiers: *Boiling water reactors, *Environmental Impact Statements.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed construction and operation of the Cooper Nuclear Station, a boiling water reactor located on the Missouri River near Brownsville, Nebraska. The exhaust steam will be cooled by once-through flow of water obtained from and discharged to the Missouri River. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Some of the environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. It is concluded that the construction permit should be continued and an operating license be issued for this facility subject to the following conditions: (1) establish before licensing a non-radiological monitoring program to extend at least 5 years and to be reviewed annually, and to provide design modifications to mitigate detrimental effects; (2) conduct a radiological monitoring program. (Houser-ORNL)
W73-15237

FIELD SPECTROMETRIC MEASUREMENTS OF RADIONUCLIDE CONCENTRATIONS AND EXTERNAL GAMMA EXPOSURE RATES AT THE NEVADA TEST SITE, A DEMONSTRATION STUDY,
California Univ., Livermore. Lawrence Livermore Lab.
L. R. Anspaugh, P. L. Phelps, G. W. Huckabay, and T. Todachine.
Available from NTIS, Springfield, Va.; $4.00 in paper copy, $1.45 microfiche. Report UCRL-51412, July 1973. 18 p, 3 fig, 1 tab.

Descriptors: *Radioisotopes, *Nuclear explosions, *Fallout, *Gamma rays, Soil contamination, Analytical techniques, Sampling, Radioactivity techniques, Nuclear wastes, *Nevada, Irradiation, Radioactivity, Instrumentation.

The information obtained by the field spectrometry method is more suitable for calculating the external dose as compared with airborne detector systems. Elimination of soil sampling makes the method relatively rapid; however, the accuracy of the dose calculation may be improved by the use of soil sampling to obtain depth-distribution data. No information is obtained concerning alpha- or beta-emitters that have no associated gamma emmission. Radionuclide concentrations and external dose calculations are given at 14 locations. Ru101, Eu152, Eu154, and Lu174 were detected only close to the Sedan crater. Rh102m was the most abundant radionuclide in the three locations closest to the crater. Cs137 was substantially above the level usually attributed to world-wide fallout. Venting of the Baneberry test contributed significantly to levels of Ru106, Mn54, Co60, Sb125, and Cs134. (Bopp-ORNL)

GREAT LAKES RADIOECOLOGY,
Argonne National Lab., Ill.
J. S. Marshall, D. N. Edgington, S. A. Spigarelli, and M. A. Wahlgren.
Available from NTIS, Springfield, Va., as ANL-7960, Part 3; $7.60 in printed copy, $1.45 in microfiche. In: Report ANL-7960, Part 3, p 1-6, Jan.-Dec. 1972. 1 fig, 1 tab.

Descriptors: *Nuclear wastes, *Strontium radioisotopes, *Radioecology, Great Lakes, Absorption, Freshwater fish, Path of pollutants, Environmental effects, Amphipoda, Opossum shrimp, Trace elements, On-site data collections, *Lake Michigan.
Identifiers: *Plutonium, *Cesium radioisotopes.

Cycling of Pu239, Cs137, and Sr90 within the Lake Michigan ecosystem is being studied by sampling organisms, sediment, and water from various locations, including present and future nuclear sites. Vertical distributions of long-lived radionuclides (Pu239, Cs137, and Sr90) are determined in selected areas of the lake to benefit estimating lake inventories. Information on vertical mixing, water-mass residence times, and sedimentation characteristics of various lake regions is obtained from comparisons of inshore and offshore concentrations of these radionuclides. Relations in the distribution and cycling in biogeochemical systems between radionuclides and other trace elements are correlated. A significant contrast lies in both the time span during which inputs have occurred, and the type of input (general atmospheric fallout for radionuclides and largely point sources for certain trace elements). (Bopp-ORNL)

THE USE OF NATURAL AND FALLOUT RADIONUCLIDES TO MEASURE RECENT SEDIMENTATION RATES IN SOUTHERN LAKE MICHIGAN,
Argonne National Lab., Ill.
J. A. Robbins, and D. N. Edgington.
Available from NTIS, Springfield, Va., as ANL-7960, Part 3; $7.60 in printed copy, $1.45 in microfiche. In: Report ANL-7960, Part 3, p 31-53, Jan.-Dec. 1972. 6 fig, 5 tab, 23 ref.

Descriptors: *Fallout, *Sedimentation rates, *Lake Michigan, *Tracers, Carbon radioisotopes, Potassium radioisotopes, Strontium radioisotopes, Lead radioisotopes, Path of pollutants.
Identifiers: *Cesium radioisotopes, *Plutonium.

The sedimentation rate is calculated from the Pb210 concentration in sediment cores, assuming constant atmospheric fallout and homogeneous mixing of an interfacial sediment layer. A small amount of data for Cs137 suggests a similar model. Although the relatively shallow depth of Cs137 occurrence requires high-resolution sampling, it appears that determination of the Cs137/Pb210 ratio for a wide range of sedimentation rates will give information about transport and deposition processes. (Bopp-ORNL)

CONSIDERATIONS IN THE ASSESSMENT OF THE CONSEQUENCES OF EFFLUENTS FROM MIXED OXIDE FUEL FABRICATION PLANTS. ENVIRONMENTAL CONSIDERATIONS AFFECTING CONSEQUENCES OF RELEASES,
Battelle-Pacific Northwest Lab., Richland, Wash.
J. M. Selby, E. C. Watson, J. P. Corley, D. A. Waite, and L. A. Carter.
Available from NTIS, Springfield, Va., as BNWL-1697, $3.00 in printed copy. In: Report BNWL-1897, p 24-45, June 1973. 17 fig, 28 tab, 135 ref.

Descriptors: *Nuclear wastes, *Industrial wastes, *Environmental effects, *Radioactivity, Air pollution, Public health, Effluents, Path of pollutants, Food chains, Potable water.
Identifiers: *Plutonium, Nuclear fuel fabrication plants.

Probabilities were developed of releasing radioactive material from a reference plant having design features consistent with the minimum criteria for new AEC plutonium facilities. The building final-filter system has two stages of high-efficiency filters. The most important exposure pathway is identified as inhalation of airborne plutonium. Pathways through consumption of drinking water and through aquatic food chains are lower by four orders of magnitude. Limits are proposed for surface contamination and for the annual dose rate to the general population from the continuous release of plutonium. An area is judged to be contaminated if the activity exceeds 10 nanocuries/sq m. The main chemical contaminants (fluorine and nitrogen) will be well below the recommended threshold limit. (Bopp-ORNL)

SYNOPTIC MEASUREMENTS OF CURRENTS AND SEDIMENT TRANSPORT ON THE CONTINENTAL SHELF, (ANNUAL PROGRESS REPORT),
Washington Univ., Seattle.
R. W. Sternberg
Available from NTIS, Springfield, Va., as RLO-2225-T21-10; $4.00 in paper copy, $1.45 in microfiche. Report RLO-2225-T21-10, April 1973. 12 p, 3 fig, 3 tab, 35 ref. AEC-AT (45-1)-2225.

Descriptors: *Sediment transport, *Oceanography, *Continental shelf, *Turbidity currents, Washington, Columbia River, Silts, Suspended solids, Waves (Water), Instrumentation, Estuarine environment, Bottom sediments, Marine geology, Currents (Water), Microenvironment, Sediment distribution.

Preliminary data from sea-floor instruments suggest that sediment transport exceeds estimates based on a threshold value of the mean bottom current. Preliminary analysis indicates that oscillatory motions due to surface waves produced relatively large concentrations of suspended sediment 100% of the time at 78 and 40 m depths, and 8% at 167 m. In a previous measurement at 80 m, sediment suspensions were produced and maintained by wave movements for at least 21 days in March. (Bopp-ORNL)

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF TURKEY POINT PLANT, UNITS 3 AND 4.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Document 50250-84; $10.60 per copy, $1.45 microfiche. Document 50250-84, July 1972. 369 p, 12 fig, 28 tab, 79 ref, 6 append.

Descriptors: *Nuclear powerplants, Effluents, *Environmental effects, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Florida.
Identifiers: *Pressurized water reactors. *Environmental Impact Statements.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed operation of the Turkey Point Plants, Units 3 and 4, Dade County, Florida. The initial cooling system will be a once-through with salt water. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, and amount of dissolved oxygen and toxic chemicals in effluent

water. The conclusion is to issue an operating license for the two units, 3 and 4, subject to further detailed evaluation of the environmental impact of construction and operation of the cooling-channel system. The applicant will also pursue evaluations of alternatives to the proposed cooling-channel system. Finally, the applicant will take corrective action for any adverse effects found. (Houser-ORNL)

ROLE OF THE ORGANIC MATTER OF A WATERWAY WITH REGARD TO RADIOACTIVE POLLUTION (INFLUENCE DES CONDITIONS D'EXTRACTION SUR LE FRACTIONNEMENT COMPORTEMENT DES ELEMENTS CHIMIQUES VIS-A-VIS DE LA MATIERE ORGANIQUE),
Commissariat a l'Energie Atomique, Cadarache (France). Centre d'Etudes Nucleaires.
J. Faure.
Available from NTIS, Springfield, Va., as CEA-R-4443; $5.45 in paper copy, $1.45 in microfiche. Report CEA-R-4443, March 1973. 53 p, 18 fig, 6 tab, 27 ref, 3 append.

Descriptors: *Chelation, *Sediments, *Nuclear wastes, *Rivers, Europe, Absorption, Organic soils, Analytical techniques, Separation techniques, Organic matter, Humic acids, Oxidation, Molecular structure, Ions, Soil contamination, Trace elements, Chemical degradation, Spectrophotometry, Chromatography.
Identifiers: Gel filtration chromatography.

Rhone River sediments were studied by analytical techniques that are described (extraction of organic matter with 0.01 N caustic, fractionation by gel filtration chromatography, and analysis for carbonyl and peroxide groups by spectrophotometry). Non-conjugated carbonyl groups contributed importantly to sorption of radionuclides. Sorption increased with increasing ionic radius (in the order Cr, Ru, Zn, Mn) in the case of the 500-1500 molecular-weight fraction, which was the largest fraction and had the highest carbonyl/peroxide ratio. The correlation with ionic radius predicts that the transition elements in the first two groups most susceptible to complexing by organic matter are: Sc (3+), Fe (3+), Ni (++), Cu (++), Y (3+), Zr (4+), Rh (++), Pd (++), and Cd (++). Lanthanides probably resemble Ce (3+), which has similar ionic radius. Hypotheses concerning sorption of other elements and the structure of complexes are discussed. (Bopp-ORNL)

RADIOCESIUM DISTRIBUTION IN WATER, SEDIMENT, AND BIOTA IN THE HUDSON RIVER ESTUARY FROM 1964 THROUGH 1970,
New York Univ. Medical Center, N.Y.
M. E. Wrenn, J. W. Lentsch, M. Eisenbud, G. J. Lauer, and G. P. Howells.
Proc. available from NTIS, Springfield, Va., as CONF-710501; $27.20 (2 vol. set) in paper copy, $1.45 per vol microfiche. In: 3rd National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tennessee, p 334-343 (1971).

Descriptors: *Hudson River, *Estuarine environment, *Fallout, *Nuclear wastes, Effluents, Nuclear powerplants, Fish, Fish diets, Sediments, Water analysis, On-site investigations, Path of pollutants, Food chains, Public health, Monitoring.

An increase in Cs137 in river water was seen in a limited section of the Hudson River from the Indian Point Nuclear powerplant although fallout is the major source. The concentrations in sediments, aquatic plants, and fish were roughly in the ratios of 30:1:1. Data on fish were modeled since fish consumption is the major route of exposure to man. It is shown that the Cs137 in sediments controls that in fish, since although the concentration in water has been decreasing (an order of magnitude since 1964) the concentration in fish has varied little from year to year (the maximum was about 56 picoCuries/kg in 1969). Concentrations were highest in bottom feeding species such as catfish and suckers, intermediate in plant-eating species such as killifish, and lowest in anadromous fish such as shad. Concentrations in the river fish were generally an order of magnitude lower than in fish from lakes in this latitude. (Bopp-ORNL)
W73-15247

ASSIMILATION AND RETENTION OF ZN65 BY THE MALLARD DUCK (ANAS PLATYRHYNCHUS),
Colorado Cooperative Wildlife Research Unit, Fort Collins.
R. D. Curnow.
Proc. available from NTIS, Springfield, Va., as CONF-710501; $27.20 (2 vol. set) in paper copy, $1.45 per vol microfiche. In: 3rd National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tennessee, p 381-383 (1971). 4 tab.

Descriptors: *Zinc radioisotopes, *Nuclear wastes, *Food chains, *Mallard duck, Aquatic environments, Absorption, Path of pollutants, Seasonal.

Assimilation and retention of Zn65 by the mallard duck (Anas platyrhynchos) as influenced by age and sex, season of year, feather molt and egg production were investigated. Absorption of oral Zn65 was influenced by season of year but not by the age or the sex. In March, absorption from the gastrointestinal tract was significantly greater than in October. The effective half-time of Zn65 in the mallard was affected by sex and season but not by the age of the duck. Zinc-65 retention was significantly greater in male mallards (P greater than 0.01) and in October. Egg production accounted for the elimination of 25% of injected Zn65. Feather molt in the mallards accounted for a 2 to 8% elimination of retained Zn65. Causative mechanisms for the observed differences in the absorption and excretion of Zn65 between male and female mallards and between seasons were discussed. (Bopp-ORNL)
W73-15248

OCCURRENCE OF RADIONUCLIDES IN THE EXOSKELETON OF TURTLES,
Mississippi State Coll. for Women, Columbus. Dept. of Physical Science.
C. M. Holcomb.
Proc available from NTIS, Springfield, Va., as CONF-710501; $27.20 (2 vol. set) in paper copy, $1.45 per vol microfiche. In: 3rd National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tennessee, p 385-389. (1971).

Descriptors: *Strontium radioisotopes, *Aquatic environment, *Turtles, *Nuclear wastes, Radioecology, Absorption, Bioindicators, Monitoring.

A preliminary investigation showed that turtles are indicators of Sr90 fallout. Advantages as long-term biological monitors are their geographic distribution, relative abundance, and long life-span. One hundred two individuals collected from six southeastern states (representing two families, six genera, and eight species) ranged in Sr90 from 0 to 282 picoCuries/g of bone ash. An inverse correlation with animal size in some taxa, and geographical differences, were found. (Bopp-ORNL)
W73-15249

UPTAKE AND RETENTION OF TUNGSTEN-181 BY CRAYFISH (CAMBARUS LONGULUS LONGEROSTRIS ORT.),
Oak Ridge National Lab., Tenn.
J. R. Reed, and B. A. Martinedes.
Proc available from NTIS, Springfield, Va., as CONF-710501; $27.20 (2 vol. set) in paper copy, $1.45 per vol microfiche. In: 3rd National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tennessee, p 390-393 (1971). 3 fig, 1 tab, 11 ref.

Descriptors: *Nuclear wastes, *Food chains, *Crayfish, Path of pollutants, Fallout, Radioecology, Absorption, Aquatic environments, Public health.

The whole-body uptake and retention of W181 was studied in crayfish (Cambarus longulus longerostris Ort.). During a 16-day uptake period in which the medium was not renewed, large animals accumulated more W181 than small ones, but uptake per gram was similar for small and large crayfish. The whole-body elimination curve for W181 consisted of two components, a rapid one-day component and a second slower component with a biological half-time of 12.2 days. The exoskeleton, GI tract, hepatopancreas, and gills reached higher concentrations than the muscle and gonads. (Bopp-ORNL)
W73-15250

IRON, MANGANESE, COBALT, AND ZINC CYCLES IN A SOUTH CAROLINA RESERVOIR,
Savannah River Ecology Lab., Aiken, S.C.
J. S. Marshall, and J. H. LeRoy.
Proc. available from NTIS, Springfield, Va., as CONF-710501; $27.20 (2 vol. set) in paper copy, $1.45 per vol. in microfiche. In: 3rd National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tennessee, p 465-473, (1971). 4 fig, 4 tab, 21 ref.

Descriptors: *Reservoirs, Plankton, Cycling nutrients, *Iron, *Cobalt, *Manganese, *Zinc, *South Carolina, Plankton nets, Suspended solids, Epilimnion, Seston, Radioecology, Seasonal, Path of pollutants, Nuclear wastes, Tracers, Zinc radioisotopes, Cobalt radioisotopes.

The distribution of Fe, Mn, Co, and Zn and the sorption of radioisotopes of these elements by seston were studied during 24 months in Par Pond, a warm monomictic reservoir in South Carolina. The dissolved and particulate forms of these elements exhibit marked seasonal variation in the epilimnion; the annual maximum concentrations are late in the thermal stratification period (April-October) and early in the fall-winter overturn. The average percentages of elements that are particulate in surface water are: Fe (65%), Mn (86%), Co (22%), and Zn (15%). Particulate Fe, Mn, and Co associate principally with inorganic matter; particulate Zn does not. The average percentages of the particulate form of elements associated with net plankton are: Fe (1.2%), Mn (0.89%), Co (4.4%), and Zn (8.7%). The fraction of added Fe59 that is retained by a filter with 0.45 micron pores after 24-hr in situ incubation closely approaches

the fraction of total iron that is particulate; however, the sorption of Mn54, Co57, and Zn65 is probably controlled by the age and concentration of the particulate manganese. (Bopp-ORNL)
W73-15251

FEEDING RATES AND FOOD UTILIZATION OF STREAM CADDISFLY LARVAE OF THE GENUS NEOPHYLAX (TRICHOPTERA:LIMNEPHILIDAE) USING COBALT-60 AND CARBON-14,
Pittsburgh Univ., Pa. Pymatuning Lab. of Ecology.
J. R. Sedell.
Proc. available from NTIS, Springfield, Va., as CONF-710501; $27.20 (2 vol. set) in paper copy, $1.45 per vol. in microfiche. In: 3rd National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tennessee, p 486-491, (1971).

Descriptors: *Fish, *Food chains, *Radioecology, *Path of polluants, Algae, Aquatic animals, Streams, Cobalt, Carbon, Absorption, Fish diets, Cycling nutrients, Aquatic environment, Trace elements.

Feeding rates and food utilization by N. concinnus were determined using Co60 and C14 as food markers and experimental designs which used the individual as a block in order to eliminate individual variation. Using a short-term radionuclide method employing Co60 passage rates of food through the gut were determined for two different instars. The type of microflora on the natural substrate did not significantly affect ingestion rates. Naturally occurring foods on stream rocks were tagged with Co60, C14 bicarbonate, and C14 glucose. Instar III and IV animals were allowed to feed on the dual-tagged substrates for 1 to 2 hr. Approximate assimilation efficiency for instar III was 15 plus or minus 2% (plus or minus S.E.), and for instar IV 26.7 plus or minus 3.0%. When instar IV animals were fed on food tagged with just Co60 and C14 bicarbonate, the approximate assimilation efficiency was between 4.7 and 6.6%. Differences in assimilation efficiencies are discussed. (Bopp-ORNL)
W73-15252

EXPERIMENTAL UPTAKE AND CHEMICAL FRACTIONATION OF IODINE-131 AND IRON-59 IN A TURTLE GRASS (THALASSIA TESTUDINUM) BED,
Puerto Rico Nuclear Center, Mayaguez.
S. E. Kolehmainen.
Proc. available from NTIS, Springfield, Va., as CONF-710501; $27.20 (2 vol. set) in paper copy, $1.45 per vol. in microfiche. In: 3rd National Symposium on Radioecology, May 10-12, 1971, Oak Ridge, Tennessee, p 829-835, (1971). 6 fig, 4 tab, 14 ref.

Descriptors: *Marine plants, *Iron, *Absorption, *Iodine radioisotopes, Nuclear wastes, Estuarine environment, Radioecology, Path of pollutants, Food chains, Water analysis.
Identifiers: *Iodine.

To obtain information about the fate of nuclear wastes, an experiment was conducted in which radioisotopes dissolved in unfiltered seawater were added to a turtle-grass bed in an outdoor container. It was deduced that knowledge of the chemical form of the radioisotope is essential for validity of the specific-activity concept, although the same specific activities of I131 and Fe59 were found in the turtle grass and sediment as in the water. Most Fe59 accumulated in sediment; most I131 in periphyton. Concentration factors for uptake by turtle grass were: Fe, 10- to 100-thousand; I, an order of magnitude lower. (Bopp-ORNL)

AMCHITKA RADIOBIOLOGICAL PROGRAM PROGRESS REPORT FOR MARCH 1972 TO DECEMBER 1972,
Washington Univ., Seattle. Coll. of Fisheries.
E. E. Held, V. A. Nelson, W. R. Schell, and A. H. Seymour.
Available from NTIS, Springfield, Va., as NVO-269-19; $5.45 in paper copy, $1.45 in microfiche. Report NVO-269-19, June 1973. 90 p, 9 fig, 27 tab, 18 ref.

Descriptors: *Radioisotopes, Absorption, *Aquatic environment, *Estuarine environment, Tritium, Strontium radioisotopes, Potassium radioisotopes, Fallout, Nuclear wastes, *Alaska, Nuclear explosions, Water analysis, Radioactivity techniques, Radioecology, Food chains, Public health, Fish, Air pollution, Algae, Vegetation, Radioecology, Monitoring.
Identifiers: Beryllium radioisotopes, *Amchitka Island.

An extensive search with sensitive instruments for radionuclides in biological and environmental samples (marine, terrestrial, freshwater) collected during the first 14 months after the Cannikin detonation indicated no contamination of the surface environment. The radionuclides found were naturally occurring (Be7 and K40 were most abundant) or were from world-wide fallout, excepting for a trace of tritium contamination in some ponds near the Long Shot nuclear test. Recent data indicate: (1) no new radionuclides except that Be7 was included in the radionuclides that were determined, and (2) an improvement in the sensitivity of analysis for tritium to about 15 tritium units. The past and present analyses are summarized, including gamma-emitting radionuclides in air filters, seawater, freshwater, marine algae, marine invertebrates, marine fish, sea otter, and freshwater organisms (moss, plants, and fish); Sr90 in rats and birds; and tritium in seawater, freshwater, and fish. (Bopp-ORNL)

MERCURY CONCENTRATIONS IN SEDIMENTS OF THE LAKE ERIE BASIN, OHIO.
Geological Survey, Columbus, Ohio.

Ohio Division of Geological Survey Information Circular No 40, 1973. D. A. Stith, compiler. 14 p, 7 fig, 2 tab, 4 ref.

Descriptors: *Water pollution sources, *Mercury, *Sediments, *Lake Erie, *Tributaries, Sampling, Chemical analysis, Instrumentation, Analytical techniques, Data collections, Rivers, Evaluation, Path of pollutants.
Identifiers: *Lake Erie tributaries.

In 1970 sediment and water samples were taken from six different Ohio tributary/harbor systems of Lake Erie. Sampling of the Black River basin was carried out in 1970 and 1971. Mercury contamination was determined on these samples soon after collection, and the results on sediment samples are presented. Definite mercury contamination was detected in the Ashtabula River, Black River, and the Grand River; minor to relatively insignificant levels of mercury were noted in the Cuyahoga River, the Maumee River, Sandusky Bay, and Lake Erie. Background concentrations of mercury can be attributed to natural, agricultural, and industrial sources. The mercury is concentrated in stream sediments by the leaching action of groundwater on soil and by removal of mercury from the atmosphere by rain. (Woodard-USGS)

THE ECOLOGY OF SOIL-BORNE PATHOGENS,
Agricultural Univ., Wageningen (Netherlands). Instituut voor Plantenziektenkundig Onderzoek
A. J. P. Oort.
Bull Oepp (Organ Eur Mediterr Prot Plant). 6 p 121-128, 1972. Illus.

Descriptors: Bacteria, Climates, Dispersal, Ecology, *Fungi, Human factor, Nematodes, *Pathogens (Soil-borne), Survival, *Virus

The complexity of the interrelations of the varying environmental factors which may affect the host, the pathogen and consequently the host-pathogen interaction is stressed. The effect of climatic conditions, soil properties, soil biota (nematodes, fungi, bacteria and viruses) and human influences is indicated. Two aspects of the ecology of soil-borne pathogens, viz. dispersal and survival, are discussed.--Copyright 1973, Biological Abstracts, Inc.

5C. Effects of Pollution

EFFECTS OF DEVELOPMENT ON SALINITY AND LIMNOLOGY OF THE LOWER COLORADO RIVER,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
D. D. Evans, S. Ince, C. C. Kisiel, H. K. Qashu, and L. G. Everett.
Available from the National Technical Information Service as PB-223 907, $3.50 in paper copy, $1.45 in microfiche. Completion Report, August 1973. 61 p, 3 fig, 9 tab, 10 ref, append. OWRR A-036-ARIZ (3). 14-31-0001-3803.

Descriptors: Water quality, Regional development, *Salinity, *Eutrophication, Water temperature, Limnology, *Colorado River, *Model studies, Arizona, Dissolved oxygen, Nitrates, Phosphates, Phytoplankton, Dissolved solids, Ecosystem, *Energy budget, Thermal stratification, Ion exchange, Sediments.
Identifiers: *Chemical-ion models.

This research was designed to assemble and analyze available data on chemical quality and limnology of reservoirs and river reaches from Lee Ferry to Imperial Dam, to determine the effects of development on salinity and to initiate the validation of models of interaction of chemical ions, sediments, biological factors and other limnological inputs such as thermal stratification and turnover. The study has completed a biological and chemical review of the Lower Colorado River, a statistical and stochastic eutrophication model, an energy-budget model, a cross-spectral analysis salinity model and shown the applicability of remote sensing of water quality. A specific chemical-ion model and aquatic ecosystem model to incorporate the above sub-models is under development.

LOCATION, IDENTIFICATION, AND CHARACTERIZATION OF PATHOGENS OF THE WATER HYACINTH,
Florida Univ., Gainesville. Dept. of Plants Pathology.
R. E. Rintz.
Available from the National Technical Information Service as PB-223 868, $5.25 in paper copy, $1.45 in microfiche. PhD Dissertation, 1973. 53 p, 8 fig, 2 tab, 56 ref. OWRR B-011-FLA (7). 14-31-0001-3268.

Descriptors: *Plant pathology, *Biocontrol, *Water hyacinth, Aquatic weeds, Florida, Louisiana, Panama, Puerto Rice, *Pathogenic fungi, Isolation, *Aquatic weed control.
Identifiers: *Rhizoctonia solani.

Surveys were conducted in Florida, Louisiana, Panama, and Puerto Rico to determine the nature and extent of diseases occurring on water hyacinth (Eichhornia crassipes). Approximately 400 microbial isolates were inoculated onto water hyacinth leaves and seven fungi produced significant lesions. Rhizoctonia solani was the most virulent pathogen isolated and it caused extensive lesions on aerial parts of the plant. Since it did not appear to be affecting other vegetation in those areas surveyed, its potential as a biocontrol agent should be further investigated. Cephalosporium zonatum was a less virulent pathogen but had a wide host range under artificial inoculation. It was shown to be identical to C. eichhorniae and C. fici on the basis of culture morphology and pathogenicity. Fusarium roseum was shown to produce metabolites causing vascular browning in water hyacinth leaves, but it proved to be a weak pathogen. Nigrospora sphaerica, Apiocarpella sp., Curvularia lunata, and Pestalotia sp. were minor pathogens which had not been previously reported on water hyacinth. A lethal disease of anchoring hyacinth (E. azurea) was found in Panama but was not identified. (Morgan-Florida)

THE EFFECTS OF DIFFERENTLY EXTRACTED ENDOTOXINS FROM ESCHERICHIA COLI ON RAINBOW TROUT (SALMO GAIRDNERI),
Providence Coll., R.I. Dept. of Biology.
G. P. O'Leary, Jr.
Available from the National Technical Information Service as PB-223 910, $2.75 in paper copy, $1.45 in microfiche. Rhode Island Water Resources Center, Providence, Completion Report, 1973, 20 p, 4 tab, 20 ref. OWRR A-039-RI (1). 14-31-0001-3840.

Descriptors: *E. coli, *Rainbow trout, Water pollution effects, *Toxicity, Bacteria, Lethal limit, Laboratory tests, *Pathogenic bacteria.
Identifiers: *Endotoxin, Lipopolysaccharide.

A laboratory study on the possible lethal effects of Escherichia coli endotoxin on rainbow trout was conducted. The investigation was conducted using endotoxin extracted from Escherichia coli by four different chemical means. The endotoxin was obtained by four mild extraction methods (ethylenediamine-tetraacetic acid (EDTA) water, trichloracetic acid, and aqueous ether) in order to more closely approximate the endotoxin naturally released by E. coli during its natural growth cycle. The endotoxin preparations were administered to the trout by introperitoneal injections in an aqueous solution. Results have shown that endotoxin extracted using EDTA caused death in the trout at concentrations of approximately 410.88 mg per Kg. body weight and 207.16 mg/Kg. body weight. Ether extracted endotoxin also was capable of causing death in trout in two to thirteen days at lower concentrations ranging from an average value of 154.62 mg/Kg. body weight to 207.23 mg/Kg. body weight. Death seems to occur more rapidly with increased endotoxin and with the use of small (younger) trout.

EFFECTS OF THERMAL DISCHARGES UPON THE CHENA RIVER,
Alaska Univ., College. Inst. of Water Resources.

Available from the National Technical Information Service as PB-224 015, $9.50 in paper copy, $1.45 in microfiche. M.S. Thesis, April, 1973, 131 p, 32 fig, 14 tab. OWRR B-020-ALAS (2).

Descriptors: *Thermal pollution, *Ice cover, Cooling water, *Alaska, Cold regions, Subarctic, *Ice fog, *Jets, Dispersion, Outlets, Discharge (Water), Diffusion.
Identifiers: Fairbanks (Alas), *Chena River (Alas).

The evaluation of several thermal discharges in Fairbanks, Alaska was carried out to determine their effects on the physical parameters of the Chena River, a typical sub-Arctic stream. In addition, the effectiveness of two discharge schemes at the main thermal source was compared. The use of a surface-spreading scheme at either source would result in a heat dissipation rate per unit area 2 to 10 times greater than use of a submerged jet. The amount of ice cover downstream from the discharges would be approximately 40% more using the submerged jet. The advantages of each discharge method are discussed and two alternative cooling methods are suggested. (Carlson-Alaska)
W73-14864

THE SIGNIFICANCE OF SELECTED PHYSICAL AND CHEMICAL VARIABLES IN BENTHIC MACROINVERTEBRATE DISTRIBUTION IN A SMALL SUBARCTIC STREAM,
Alaska Univ., College. Inst. of Water Resources.
D. L. Ward.
Available from the National Technical Information Service as PB-224 055, $3.50 in paper copy, $1.45 in microfiche. M.S. Thesis 1972, 62 p, 10 tab, 12 fig, 85 ref. OWRR B-017-ALAS (2).

Descriptors: Streams, *Benthos, Physical properties, Subarctic, *Alaska, Velocity, *Mayflies, *Caddisflies, Aquatic insects, Stoneflies, Temperature, *Dissolved oxygen, Hydrogen ion concentration, Distribution patterns.
Identifiers: *Goldstream Creek (Alas).

The objective was to determine whether temperature, velocity, dissolved oxygen, or pH operate singly, synergistically, or additionally, to control or limit distribution of Ephemeroptera (mayflies), Plecoptera (stoneflies), and Trichoptera, (caddisflies), in Goldstream Creek. Ephemeroptera, Trichoptera and Plecoptera composed 90.8%, 9.1% and 0.1% of the total number of organisms collected during the sampling period. Only fourteen stoneflies were sampled and this proved to be too small a number from which to draw any conclusions. Trichopterans occurred in highest numbers in areas not heavily populated with Ephemeroptera. The station where the largest total number of caddisflies were collected had the highest water velocity and was the furthest downstream station. Normal downstream changes in water quality such as increased temperature, solids, color and turbidity, and decreased dissolved oxygen are also suspected to influence this separation of the mayflies and caddisflies. At the station with highest water velocity the caddisflies distributed themselves so that the numbers collected were inversely related to water velocity. Thus, the water velocity-caddisfly number relationship found was complex. Further research is recommended on the influence of low dissolved oxygen on the macroinvertebrate benthos as the dissolved oxygen level in this stream often falls as low as 0.5 mg/l or less during the winter. THE DRIFT OF BENTHIC INVERTEBRATES IN GOLDSTREAM CREEK, ALASKA,
Alaska Univ., College. Inst. of Water Resources.
J. R. Clay.
Available from the National Technical Information Service as PB-224 009, $6.75 in paper copy, $1.45 in microfiche. M.S. Thesis 1973, 83 p, 10 fig, 5 tab, 51 ref. OWRR B-017-ALAS (3).

Descriptors: Benthos, *Aquatic drift, *Diptera, Ephemeroptera, Physical properties, *Alaska, Subarctic, *Mayflies, Caddisflies, Water temperature, *Diurnal distribution, Light, Discharge (Water).
Identifiers: *Goldstream Creek (Alas).

The objectives were to determine if there was any diurnal variation in the amount of drift; what organisms were present in the drift; and to evaluate several physical parameters, including light intensity, water temperature and stream discharge with respect to their influence on the drift of macro-invertebrates in Goldstream Creek. Ephemeroptera (Mayflies) and Diptera (two-winged flies) were the only orders represented consistently within the drift. Ephemeroptera exhibited a definite diurnal periodicity during the second, third and fourth (of four) sampling periods, while Diptera exhibited a similar periodicity during the third and fourth sampling days. Both orders peaked in abundance, as caught with a drift net, after sunset. The greatest numbers of both orders captured during the study were collected on the sampling day during which the highest water temperature was measured.

THE EFFECT OF THERMAL INPUTS ON THE POPULATIONS OF FISH AND MACROINVERTEBRATES IN THE WABASH RIVER,
DePauw Univ., Greencastle, Ind.
J. R. Gammon.
Available from the National Technical Information Service as PB-224 056, $4.25 in paper copy, $1.45 in microfiche. Purdue University Water Resources Research Center, Lafayette, Indiana, Technical Report No. 32. 1973. 106 p, 45 fig, 9 tab, 27 ref. OWRR B-031-IND (4).

Descriptors: *Fish populations, *Fish migration, *Electric powerplants, *Water temperature, Electric shocking gear, Nets, Catfish, Sauger, Suckers, Bass, Fish harvest, Fish reproduction, Thermal powerplants, Thermal water, Warm-water fish, *Indiana, Thermal pollution, *Invertebrates, Thermocline, Distribution patterns, Fish behavior.
Identifiers: *Wabash River (Ind), Redhorse species, Wabash Station, Cayuga Station.

The distribution of fish and macroinvertebrate populations near two electrical generating stations located on the Wabash River were examined during the summer and early fall for six years. Segments of the river were subdivided into zones corresponding to the imposed thermal conditions and to different kinds of habitat. Fish responded readily to changing thermal conditions and concentrated in areas of the river which provided temperature close to their optimum. Although most species reacted behaviourally to the alterned thermal conditions, only two groups appeared to be affected permanently as populations. Flathead catfish (pylodictis Olivaris) responded to higher temperatures with enhanced reproductive success which increased population density two or three times. Redhorse (moxostoma erythrurum and M. breviceps) are more thermally sensitive and population densities are likely to be reduced with higher temperatures. Complicating factors include the fact that several species of fish, including redhorse and sauger (Stizostedion canadense), appear to rely upon recruitment from tributaries to sustain the mainstem populations. Long-term changes in the density of other species were not detected. (Wiersma-Purdue)

EFFECTS OF TEMPERATURE, RATION, AND SIZE ON THE GROWTH OF JUVENILE STEELHEAD TROUT, SALMO GAIRDNERI,
Oregon State Univ., Corvallis.

Wayne A. Wurtsbaugh.
Available from the National Technical Information Service as PB-224 016, $6.75 in paper copy, $1.45 in microfiche. MS Thesis, June 1973. 69 p. B-027-ORE. 14-31-0001-3633.

Descriptors: Stream temperature effects, Fish studies, Trout, Temperature effects.
Identifiers: Thermal pollution.

The effects of temperature, temperature fluctuation, and fish size on the growth of juvenile steelhead trout (Salmo gairdneri) were studied in experiments which lasted 10-25 days. Groups of fish were fed at ration levels varying from near-starvation to repletion. Decelerating, curvilinear relationships between rates of food consumption and growth were defined in most of the experiments. At ration levels near maintenance, temperatures raised 3-6 C above the seasonal ambient temperatures decreased the growth of the trout. As feeding rate increased, the detrimental effect of temperature on growth was ameliorated. At repletion feeding levels, elevation of temperature up to about 17C increased trout growth by increasing the maximum food consumption rates of the fish. Large daily temperature fluctuations of 4-8C did not increase growth rates and in some cases decreased growth rates to levels below those of fish kept at constant temperatures. Periodic sampling of steelhead trout indicated that growth rates of wild trout ranged from -0.18 to 1.6% day. Food consumption rates of wild trout were estimated to range from 2 - 7.6% day; considerably less than the maximum consumption rates of laboratory fish. At these food consumption rates it is estimated that stream temperature increases above normal would decrease growth rates of wild steelhead trout.

GROWTH AND FOOD CONSUMPTION OF JUVENILE COHO SALMON EXPOSED TO NATURAL AND ELEVATED FLUCTUATING TEMPERATURES,
Oregon State Univ., Corvallis.
Larry B. Everson.
Available from the National Technical Information Service as PB-224 059, $6.25 in paper copy, $1.45 in microfiche. MS Thesis, June 1973. B-027-ORE. 14-31-0001-3633.

Descriptors: Stream temperature effects, Fish studies, Salmon, Temperature.
Identifiers: Thermal pollution.

Relationships between rates of food consumption, growth and food assimilation of juvenile coho salmon were determined for different experimental temperature conditions during the short-term, 30-day experiments. The efficiency of food assimilation was determined by measuring the quantities of food consumed and the amounts of fecal wastes produced. Concurrent long-term studies were conducted over four and eight-month periods under similar temperature conditions. Growth rates of salmon at equivalent ration levels were compared between the short and long-term experiments. The growth rates of control fish were generally greater than those of fish exposed to elevated temperatures for each of the five short-term experiments. Increased rations ameliorated the effects of elevated temperatures on growth rates. The results of the study suggest that temperature criteria for juvenile coho derived from measurements based upon constant temperatures may not be satisfactory for protecting the fish during the extended period of their freshwater existence. Measurements of salmon growth during long-term experiments indicated that any substantial increases of temperature would result in a reduction in the size of smolts. Significant reductions of growth resulting from higher temperatures could influence the production of salmon populations through decreased marine survival.

EUTROPHICATION OF SHELTERED BAYS IN A LARGE LAKE,
Utah Center for Water Resources Research, Logan.
W. T. Helm.
Available from the National Technical Information Service as PB-224 060, $3.75 in paper copy, $1.45 in microfiche. Final Report (1972). 80 p, 12 fig, 18 tab, 52 ref. OWRR B-056-UTAH (1).

Descriptors: *Eutrophication, *Harbors, *Lakes, *Breakwaters, *Currents (Water), Utah, Idaho, Bottom sampling, Water chemistry, Aquatic plants, Benthic fauna, Invertebrates, Sediments, Shore, Ecological distribution, Coliforms, Silts, Clays, Organic matter, Dissolved oxygen, Diptera, Environmental gradient.
Identifiers: Effects of breakwaters, *Bear Lake (Utah-Idaho).

Wether undesirable changes occur in bays, expecially those formed by breakwaters, was studied in Bear Lake, Utah-Idaho. The quantity of influent water was measured, the differences in quality in the bay from the lake determined, and a comparative study of any measurable biological responses possibly related to differences in water quality made. Measured water chemistry parameters did not differ from one location to another in Bear Lake. Coliform bacteria appeared concentrated on shore side of breakwaters as a result of water currents. Organic matter varied inversely with depth. Amounts of silt-clay were greatest in protected areas. Dissolved oxygen in near-bottom water varied inversely with both organic matter and temperature. Transects in protected areas had a greater average aquatic macrophyte occupancy than transects in exposed areas and plants were taller in protected areas. Chironomid numbers and distributions were influenced by silt-clay, organic matter, dissolved oxygen, and degree of protection from currents. Sheltered areas, protected by bays or breakwaters, contained conditions more favorable for development of vegetation and populations of some chironomid species than areas exposed to full force of water currents. There is an apparent annual eutrophication cycle in sheltered bays. (Jones-Wisconsin)

A STUDY OF TOXICITY AND BIOSTIMULATION IN SAN FRANCISCO BAY-DELTA WATERS, VOLUME I, SUMMARY REPORT,
California State Dept. of Water Resources, Sacramento.
R. L. Brown, and L. A. Beck.
October 1972. 94 p, 22 fig, 8 tab, 26 ref, 1 append.

Descriptors: *Toxicity, *Eutrophication, *Water pollution effects, *Water pollution control, *California, Waste treatment, Standards, Water quality, Bioassay, Biota, Algae, Wastes, Fish, Effluents, Dispersion, Statistical methods, Estuaries, Benthos, Outlets, Dispersion, Regression analysis, Municipal wastes, Chlorination, Industrial wastes, Indicators.
Identifiers: *San Francisco Bay-Delta (Calif.), Species diversity index.

Studies on toxicity and biostimulation in San Francisco Bay-Delta waters for information on use of estimated in situ toxicity concentration as a waste management criterion are summarized. Toxicity of municipal wastes can be effectively reduced by biological treatment or by a combination of physical-chemical processes. Industrial waste toxicity certainly can be lowered by appropriate treatment, but treatment processes tailored to remove specific toxicants would probably be preferable to more generalized processes. Benthic species diversity is at least a rough idea of the health of aquatic biological communities while fish populations are rather difficult to sample quantitatively. In spite of taxonomy difficulties in obtaining benthic community diversity indices, they are probably more informative in evaluating pollution effect and are easier to obtain than similar indices for fish populations. Another approach to determine community health was the artificial substrate or aufwuchs community bioassays. These assays can be used as direct indicators without requiring complete identification of colonizing organisms. A toxicity objective of 0.04 toxic unit is based on relationships derived from stickleback acute toxicity bioassay data. (See W73-14877 thru W73-14881) (Jones-Wisconsin)
W73-14876

A STUDY OF TOXICITY AND BIOSTIMULATION IN SAN FRANCISCO BAY-DELTA WASTERS, VOLUME II, A STATISTICAL EVALUATION OF THE RELATIONSHIP BETWEEN TOXICITY AND SPECIES DIVERSITY INDEX.
Hydroscience, Inc., Westwood, N.J.

California Department of Water Resources, Sacramento, November 1972. 249 p, 83 fig, 21 tab, 20 ref, 3 append.

Descriptors: *Wastes, *Bioindicators, *Toxicity, *Biota, *Statistical methods, Regression analysis, *California, Benthic fauna, Plankton, Microorganisms, Zooplankton, Methodology, Municipal wastes, Industrial wastes, Bioassay, Fish, Estuaries.
Identifiers: *Species diversity index, *San Francisco Bay-Delta (Calif.).

Methods and results of a statistical reevaluation of data collected during the University of California Comprehensive Study of San Francisco Bay, 1960-1964 are described. Significant correlations between species diversity indices and relative toxicity are quantitatively defined. Results of the analysis are presented in the form of regression equations which indicate intercorrelations between diversity indices, relative toxicity, and other water quality factors. Results are presented for benthic animal, microplankton, and zooplankton species diversity indices. Toxicity concept is derived from correlations between wastewater strength and its toxic effects on marine flora and fauna. Acute waste toxicity is determined by a 48- or 96-hour static or continuous flow bioassay test, depending on definition. Test organisms may vary, but a fish species (stickleback) is most commonly used. The Margalef Diversity Index employed is a measure of the flora or fauna species diversity in a sample. These results suggest that calculated conservative relative toxicity can be considered as a candidate variable for use in a regulatory policy. It may be difficult to determine if a waste management program is effective with the use of a benthic species diversity index as a criterion of a biotic health. (See also W73-14876) (Jones-Wisconsin)

A STUDY OF TOXICITY AND BIOSTIMULATION IN SAN FRANCISCO BAY-DELTA WATERS, VOLUME III, ACUTE TOXICITY OF DISCHARGED WASTES,
California State Dept. of Fish and Game, Sacramento.
D. C. Wilson, and C. R. Hazel.
Prepared for California Water Resources Control Board, Sacramento, October 1971. 113 p, 6 fig, 25 tab, 20 ref, 2 append.

Descriptors: *Toxicity, *Biological communities, *Bioassay, *Industrial wastes, *Municipal wastes, Fish, Estuaries, *California, Measurement, Effluents, Phenols, Lethal limit, Food processing industry, Oil wastes, Organic compounds, Pulp wastes, Chemical wastes, Lead, Methodology, Benthic fauna.
Identifiers: *Biostimulation, *San Francisco Bay (Calif.), San Pablo Bay (Calif.), Tolerance limit, Sub-lethal effects, San Joaquin River (Calif.).

Static and continuous-flow bioassays were used to determine 96-hour acute toxicities of selected municipal and industrial wastes to several fish and invertebrate species. Mass acute toxicity emission rates are given relative to variations in flow, waste strength, and species sensitivity. Special studies included acute toxicity bioassays to define the relationship between salinity and sensitivity of fish to phenol, parallel static and continuous-flow bioassays for comparative purposes, and a sublethal response bioassay conducted to relate differences in growth and food consumption to waste concentration. In comparing continuous-flow and static bioassay of municipal and industrial wastes, the 96-hour static bioassay of composite samples of an unchlorinated municipal waste renewed daily is sufficient to estimate the acute toxicity threshold level; chlorinated municipal wastes should be tested using in-line continuous-flow 96-hour bioassay; industrial effluents should be tested using in-line continuous-flow bioassay systems for a minimum of 96-hours for 7 to 14 days as necessary. The 96-hour Median Tolerance Limit values are given for municipal (primary chlorinated, secondary chlorinated, secondary unchlorinated) and industrial wastes. The array of test species used was sufficiently sensitive to demonstrate toxicity of all wastes tested in continuous-flow bioassay. (See also W73-14876) (Jones-Wisconsin)

A STUDY OF TOXICITY AND BIOSTIMULATION IN SAN FRANCISCO BAY-DELTA WATERS, VOLUME VI, BIOASSAYS OF LOWER TROPHIC LEVELS,
California Univ., Berkeley. Sanitary Engineering Research Lab.; and California Univ., Berkeley. School of Public Health.
H-J. Krock, and D. T. Mason.
Prepared for California Water Resources Control Board, Sacramento. SERL Report No. 71-8, October 1971. 123 p, 52 fig, 12 tab, 86 ref.

Descriptors: *Eutrophication, *Bioassay, *Trophic level, *Toxins, Phosphates, Nitrites, Biological communities, Photosynthesis, Respiration, Plankton, Bicarbonates, *California, Measurement, Copper, Mercury, Water pollution effects, Sewage effluents, Sewage treatment, Water pollution sources, Bays, Estuaries, Periphyton, Chlorine, Food webs, Balance of nature.
Identifiers: *San Francisco Bay-Delta (Calif.).

Bioassay methods measuring toxicant and stimulant effects on native organism communities were developed and applied. One method employed organisms settling and growing on artificial substrates (aufwuchs communities), response measurements being photosynthetic rate changes. Another used photosynthesis rate of native plankton indicated by C-14 labeled bicarbonate uptake rates. Effects of known toxicants and possible stimulants and of sewage with various degrees of treatment on supporting trophic levels of San Francisco Bay were evaluated. Short-term metabolic responses of test communities to a perturbation were compared with long-term growth response of communities subjected to similar perturbations. Copper and mercury are probably now stressing lower trophic level organisms in central San Francisco Bay. Simple organic compounds probably stimulate aufwuchs photosynthesis indirectly. Municipal sewage primary effluent stimulated aufwuchs photosynthesis at concentrations 5 to 10% and depressed photosynthesis at greater concentrations. Biological secondary treatment with activated sludge and tertiary treatment with lime precipitation and recarbonation and ammonia removal by ion exchange reduced stimulation of respiration and photosynthesis inhibition. Combined chlorine residual in domestic sewage effluent depressed all metabolic functions measured. Chlorinated effluent was found to inhibit growth while low concentrations of unchlorinated effluent stimulated growth. (See also W73-14876) (Jones-Wisconsin)

A STUDY OF TOXICITY AND BIOSTIMULATION IN SAN FRANCISCO BAY-DELTA WATERS, VOLUME VII, EFFECTS OF SELECTED WASTE DISCHARGES ON BENTHIC INVERTEBRATE COMMUNITIES,
California State Dept. of Fish and Game, Sacramento.
D. A. Daniel, and H. K. Chadwick.
Prepared for California Water Resources Control Board, Sacramento, October 1971. 153 p, 33 fig, 2 tab, 15 ref, 18 append.

Descriptors: *Benthos, *Toxicity, *Wastes, *Water pollution effects, Invertebrates, *California, Effluents, Biological communities, Bio-indicators, Estuaries, Water quality, Municipal wastes, Industrial wastes, Dispersion, Bioassay, Fish, Sampling, Speciation.
Identifiers: *San Francisco Bay (Calif.), Suisan Bay (Calif.), San Pablo Bay (Calif.), San Joaquin River (Calif.), Biological diversity, Waste dispersion.

The basic approach was to select waste discharges with dispersion zones in which waste concentrations could be defined and in which waste toxicity would be the primary variable potentially affecting benthic invertebrates. Abundance of individual invertebrate species and community diversity were measured at points covering the range of waste concentrations present. Observed trends in community characteristics were then compared with toxicity concentration calculated from acute toxicity bioassays on fish, conducted in another portion of the study. The observed effects on benthic invertebrate communities were apparently principally caused by the toxic character of the wastes. Diversity and numbers of benthic invertebrates were inversely related to waste concentration, with the exception of a direct relationship in diversity at San Leandro. The similarity of communities during two sampling periods indicate that the communities integrate environmental effects over a considerable period of time; this is valuable in evaluating long-term effects of pollution, but has limited value in evaluating short-term effects. Diversity, numbers and individual species distribution should all be considered in evaluating benthic invertebrate communities. Great care must be taken to establish the correct identification of all specimens. (See also W73-14876) (Jones-Wisconsin)
W73-14880

A STUDY OF TOXICITY AND BIOSTIMULATION IN SAN FRANCISCO BAY-DELTA WATERS, VOLUME VIII, ALGAL ASSAYS OF SELECTED WASTE DISCHARGES,
California State Dept. of Water Resources, Sacramento.
R. L. Brown, and G. Varney.
Prepared for California Water Resources Control Board, Sacramento, October 1971. 59 p, 14 fig, 10 tab, 17 ref, (append; x-Review of Biostimulation, by H. K. Chadwick).

Descriptors: *Algae, *Bioassay, *Wastes, *Toxicity, *Eutrophication, Biological communities, *California, Methodology, Sewage effluents, Plant growth, Oil wastes, Municipal wastes, Trace elements, Industrial wastes.
Identifiers: *San Francisco Bay-Delta (Calif.).

In further evaluating overall toxicity and biostimulation, data were obtained on the biostimulatory nature of some selected waste discharges with the added goal of evaluating available algal assay procedures. Laboratory batch algal assays were conducted using wastes from six San Francisco Bay area discharges (four municipal and two refinery effluents). One of the refinery wastes was assayed using three suggested algal assay methods concurrently--batch test, chemostat continuous flow, and in situ. Results of batch assays of municipal wastes indicate that addition of unchlorinated wastes caused increased algal growth in laboratory cultures. The two refinery effluents tested caused different algal growth responses in laboratory cultures which could be attributed to differences in nutrient concentrations. Application of the laboratory data to growth conditions in the Bay is difficult. The assay method selected will depend on type of biostimulation study. Laboratory batch tests can be used for screening purposes; continuous flow assays can be used to determine the constants in the kinetic growth equation; and the in situ tests approximate more closely natural conditions of light and temperature. All but one of the wastes examined had the theoretical potential to cause increased algal growth. (See also W73-14876) (Jones-Wisconsin)

THE DETECTION OF A BOUND FERREDOXIN IN THE PHOTOSYNTHETIC LAMELLAE OF BLUE-GREEN ALGAE AND OTHER OXYGEN EVOLVING PHOTOSYNTHETIC ORGANISMS,
King's Coll., London (England). Dept. of Botany.
M. C. W. Evans, S. G. Reeves, and A. Telfer.
Biochemical and Biophysical Research Communication, Vol 51, No 3, p 593-596, 1973. 2 fig, 7 ref.

Descriptors: *Biochemistry, *Photosynthesis, *Cyanophyta, Chlorophyta, Anabaena, Euglena, Beans, Sorghum, Spectroscopy, Chlorella.
Identifiers: *Electron acceptor, Electron transport, Ferrodoxin, Chloroplasts, Anabaena cylindrica, Euglena gracilis, Phaseolus vulgaris, Sorghum bicolour, Chlorella vulgaris.

A chloroplast component with an electron paramagnetic resonance (EPR) spectrum similar to that of ferredoxin is photoreduced at 77 Kelvin or lower temperatures in spinach chloroplasts. It has been proposed that this component is the primary electron acceptor of photosystem I. Lamellar particles were prepared from the blue-green alga Anabaena cylindrica. Chloroplasts were prepared from Euglena gracilis and from 14-day old greenhouse grown beans (Phaseolus vulgaris) and from greenhouse grown sorghum (Sorghum bicolour). Samples for EPR spectroscopy were prepared and the spectra obtained using a Varian E4 spectrometer. The presence of an electron transport component was demonstrated in all four preparations. Similar signals have been observed in chloroplasts from Euglena gracilis and whole cells of Chlorella vulgaris, although the signals are very small and difficult to observe in these organisms. The presence of a bound ferredoxin in the photosynthetic lamellae of such a diverse group of organisms, and the demonstration that in all these organisms the ferredoxin can be photoreduced at 77 Kelvin, is strong supporting evidence for the proposal that this ferredoxin is the primary acceptor of electrons in the photosynthetic electron transport system of all oxygen evolving organisms. (Jones-Wisconsin)

DIFFERENTIAL RESPONSES OF MARINE PHYTOPLANKTON TO HERBICIDES: OXYGEN EVOLUTION,
Environmental Protection Agency, Gulf Breeze, Fla. Gulf Breeze Lab.
T. A. Hollister, and G. E. Walsh.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 5, p 291-295, 1973. 2 tab, 7 ref.

Descriptors: *Pesticide kinetics, *Marine algae, *Herbicides, Fungicides, Ureas, Triazine pesticides, Chlorinated hydrocarbon pesticides, Inhibition, *Pesticide toxicity, *Phytoplankton, Chlorophyta, Chrysophyta, Organophosphorus pesticides, Rhodophyta, Bioassay, Lethal limit.
Identifiers: *Oxygen evolution, Pesticide effects, Neburon, Diuron, Atrazine, Ametryne.

The varying responses of marine unicellular algae to herbicides are described. Eighteen species were tested against the substituted ureas, neburon and diuron, and the triazines, atrazine and ametryne. Effects of herbicides were measured as inhibition of oxygen evolution. Both ureas and triazines inhibit photosynthesis and move quickly into the cells and the concentrations required for inhibition of both growth and photosynthesis are the same. Species of the family Bacillariophyceae were generally the least sensitive, requiring as much as 5.8 times more ametryne to reduce oxygen evolution by 50% than did species of the other families. All data were subjected to statistical analysis. Wide variations occurred in response to the toxicants among the individual species of the families Chlorophyceae, Bacillariophyceae, and Chrysophyceae. In bioassay analyses conducted for effects of herbicides on marine unicellular algae, two factors are particularly important: response in relation to familial taxonomic position, and wide range of response by individual species within a given family. It is necessary, therefore, to use several species from each of several families in algal bioassay studies to obtain realistic data concerning herbicidal effects on algae. (Jones-Wisconsin)
W73-14883

EFFECTS OF NUTRIENT ENRICHMENT AND A ROUGH FISH POPULATION (CARP) ON A GAME FISH POPULATION (SMALLMOUTH BASS),
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
T. A. Haines.
Transactions of the American Fisheries Society, Vol 102, No 2, p 346-354, 1973. 6 fig, 6 tab, 28 ref.

Descriptors: *Fish populations, *Eutrophication, *Fertilization, Sport fish, Carp, *Bass, Nitrogen, Phosphorus, Growth rates, Productivity, Spawning, Nutrients.

Decline of game fish may be due to physical, environmental changes, to interference from rough fish, better adapted to enriched conditions, or to some combination of these factors. To test effects of nutrient enrichment and a rough fish population, (Cyprinus carpio), on a game fish population (Micropterus dolomieui), individually and in combination, two fertility levels (low and high) were established in a series of artificial ponds. Low fertility ponds were undisturbed, while nitrogen and phosphorus were added once every two weeks to high fertility ponds. Replicates of three fish population types were established at each fertility level: game fish only, rough fish only, and game and rough fish in combination. Growth rate recorded after 15 months was used as an index of the status of the fish populations. High and low fertility ponds differed in nutrient concentrations, oxygen level, amount of food organisms, turbidity, and temperature. Bass growth rate in high fertility ponds was significantly lower than in low fertility ponds; carp growth rate in high fertility ponds was significantly higher than in low fertility ponds. Nutrient enrichment was detrimental to smallmouth bass and beneficial to carp. The two populations combined did not affect each other. (Jones-Wisconsin)

THE EFFECTS OF HARVESTING AQUATIC MACROPHYTES ON ALGAE,
Wisconsin Univ., Madison.
S. A. Nichols.
Wisconsin Academy of Sciences, Arts and Letters, Vol 61, p 165-173, 1973. 3 fig, 2 tab, 10 ref.

Descriptors: *Harvesting, *Aquatic weed control, *Algae, *Wisconsin, Productivity, Depth, Management, Shallow water, Competition.
Identifiers: *Lake Mendota (Wis.), Antagonistic relationship, Water milfoil.

To determine whether control of aquatic macrophytes by harvesting would lead to increased algal production, both long and short term effects of harvesting were studied over three years in University Bay of Lake Mendota, Wisconsin, in one shallow water area, uniformly 1 m deep (inside a sandbar), and another 1.0 - 1.6 m deep (outside the sandbar). At the middle of each month, prior to each harvest, two random, 1 sq m samples were taken from appropriate harvested and control areas. Macrophytes and filamentous algae were collected and dry weight obtained for each. A significant increase in algal biomass was found 1 year after 2 years of harvesting, in shallow water areas (depth 1 m). This increase was concomitant with a decrease in macrophytes. In the deeper water (average depth 1.3 m) a drop in macrophyte biomass was accompanied by a drop in algal biomass. Productivity differences were also found between shallow and deep water areas. In deep water, peak productivity for algae and macrophytes occurred at nearly the same time. Peak macrophyte productivity was accompanied by low algal productivity in shallow water. (Jones-Wisconsin)

LIMNOLOGICAL STUDIES ON SOME LAKES IN THE NETHERLANDS: I. A LIMNOLOGICAL RECONNAISSANCE AND PRIMARY PRODUCTION OF WIJDE BLIK, AN ARTIFICIALLY DEEPENED LAKE,
Hydrobiologisch Institutt, Nieuwersluis (Netherlands).
R. D. Gulati.
Freshwater Biol. Vol 2, No 1, p 37-54, 1972.
Identifiers: Bosmina-coregoni, Copepoda, Desmids, Diatoma-elongatum, Lakes, Limnological studies, Microcystis, *Netherlands (Wijde-blik), Plankton, *Primary production, Reconnaissance, Wijde-blik, *Zooplankton.

Most Dutch lakes are small and shallow, resulting from peat dredging since the late 18th century. However, deep lakes have appeared recently owing to sand digging. Limnological features of one such lake, Wijde Blik (N Holland), were studied during 1968-70. The lake is one of the deepest and biggest in the Loosdrecht-lakes area. The lake is 125 cm below sea level, and underground water movements play an important part in the lake's hydrology. The lake exhibits thermal stratification on warm and calm days; since the lake surroundings are open and flat, wind and nocturnal cooling destroy such a stratification. There is continuous circulation from autumn through spring. The O2 saturation (%) in the upper water varies from 70 to 120%. Bottom waters were never anaerobic (lowest values 10% O2 saturation). Cl- and HCO3 were dominant anions just as Ca++ and Na+ formed the main cations. Chlorides have increased 2.5-fold in the 40 yr as a geochemical consequence of deepening. The surface drainage has minor influence on lake's water chemistry. The SiO2-Si decreased from February 1969 to June 1969 as Diatoma elongatum increased. Chlorococcales were the important lake algae. Desmids were poor. Microcystis dominated from July-September, achieving from 15 to 31 colonies/ml. Poor light transmission rather than nutrients limits plankton growth and primary production in the lake. Copepoda were the dominant zooplankton. Bosmina coregoni recorded between 2 and 44 individuals/l in summer 1968 and was the main cladoceran.--Copyright 1973, Biological Abstracts, Inc.

Available from the National Technical Information Service as AD-753 663, $3.00 in paper copy, $1.45 in microfiche. Technical Report EHL (K) 70-9, August 1970. 101 p, 25 fig, 20 tab, 17 ref. 69-10.

Descriptors: *Water pollution sources, *Toxicity, *Sewage bacteria, *Photography, Biological communities, Chemicals, Toxins, Waste water disposal, Activated sludge, Degradation (Decomposition), Industrial wastes, Bioassay.
Identifiers: *Photographic wastes, Kodak EA-4, Kodak Ektachrome RT Processor, Silver.

Photographic chemicals generated by the Kodak Ektachrome RT Process using Kodak EA-4 processing chemicals were tested for toxicity to Daphnia magna (water flea) and Pimephales promelas (fathead minnow) and toxicity to and degradability by sewage treatment microorganisms. Desilvered waste is successfully degraded by and is non-toxic to sewage organisms at concentrations as high as 0.05% chemical waste. The toxicity data of the individual baths were used to predict highest concentration of combined waste that would be non-toxic to microorganisms. Desilvering the fixing baths allowed 0.2% composited EA-4 waste to be successfully treated by activated sludge plants. Extreme toxicity of non-desivered EA-4 waste to activated sludge organisms is caused by accumulation of silver in the sludge. Under no circumstances may the untreated EA-4

bleach be safely released into streams. An unknown amount of iron cyanides and thiocyanates (less than 3.5 mg/l assuming good plant performance) will be present in the effluent. Subsequent chlorination and sunlight action may result in substantial conversion of the chemicals to highly toxic cyanide compounds. This a 10-fold dilution of the treatment plant effluent (preferably 100-fold) is necessary for any treatment plant routinely containing EA-4. (Jones-Wisconsin)

SUBLETHAL EFFECTS OF CRUDE OIL ON LOBSTER, (HOMARUS AMERICANUS) BEHAVIOR,
Woods Hole Oceanographic Institution, Mass.
J. Atema, and L. Stein.
Available from the National Technical Information Service as PB-213 872, $4.85 in paper copy, $1.45 in microfiche. Report to Environmental Protection Agency, Technical report WHOI-72-74. September 1972. 76 p, 18 fig, 5 tab, 10 ref, 4 append. GPA Project 18080 EBN.

Descriptors: *Pathology, *Lobsters, *Animal behavior, *Oil pollution, Animal physiology, Seawater, Marine animals, Organic compounds, Feeding rates, Laboratory tests.
Identifiers: *Sublethal effects, Crude oil, Homarus americanus.

Methods of determining sublethal effects of crude oil and its waste soluble fractions on lobsters were developed under carefully controlled conditions. The most reproducible pattern in the lobsters' behavior, its feeding, was used as a standard for measuring sublethal oil effects. As a measure of physiological damage, the microscopical and submicroscopical structures of the aesthetasc hairs on the antennules were chosen; these serve an olfactory function and together with the gills are probably the membranes most sensitive to the outside environment. Light and electron microscopy showed no observable changes in morphology of odor receptors. Results are interpreted as the depressing quality of crude oil as a bad odor effect. Small quantities of crude oil (0.9 ml in 100 l of seawater) interfere with some specific, possibly chemosensory behavior. Chemical analyses showed that before addition of oil a great quantity of lipids was present in the test aquaria. When water was brought in contact with an oil slick, lipid concentration dropped. The same effect was seen in the alkane and the alkene-aromatic hydrocarbon fractions. Oil in sea water followed the usual degradation pattern. (Jones-Wisconsin)

MAJOR CAUSE OF ALGAE AND WEEDS IN LAKE MENDOTA,
Wisconsin Univ., Madison.
M. S. Nichols.
Transactions of the Wisconsin Academy of Sciences, Arts and Letters, Vol 61, p 229-234, 1973. 1 tab, 5 ref.

Descriptors: *Plant growth, *Bicarbonates, *Alkalinity, *Wisconsin, Algae, Carbon dioxide, Hardness (Water), Aquatic weeds, Calcium, Magnesium, Hydrogen ion concentration, Marl, Nutrients.
Identifiers: *Lake Mendota (Wis.).

In the absence of carbon dioxide or a deficiency from sources other than the atmosphere, the low partial pressure of carbon dioxide in the air limits the rate and quantity of this gas solution in lake water to the extent that large and extended blooms of algae and weed growths would be materially limited. In lakes with a low bicarbonate content, carbon dioxide could be a critical factor for extensive growths of algae and weeds. The bicarbonates of calcium and magnesium in hard-water Lake Mendota, Wisconsin, are the major source of carbon dioxide, as shown by the lowering of the hydrogen ion concentration during extensive growths, causing a rise in pH to 9.5 or 10 and above following rapid growth during hot weather. At times the pH rise causes precipitation of marl deposits in the calcareous waters. Nitrogen, phosphorus, sulfur, and traces of many other elements must be in adequate supply in these bicarbonate waters if growth of algae and weeds is to occur in sufficient quantity to become a nuisance. There is an adequate supply of phosphorus and nitrogen in Lake Mendota from land drainage, precipitation, springs, and through active decomposition of dead algae and weed substances. (Auen-Wisconsin)

HEPATIC AMOEBIASIS IN CEYLON,
Colombo North Hospital (Ceylon).
S. Ramachandran, S. Sivalingham, and J. R. A. Perumal.
J Trop Med Hyg. Vol 75, No 2, p 23-33, 1972, Illus.
Identifiers: *Ceylon, Erythrocyte, *Hepatic amoebiasis, Human pollution, Sedimentation, *Amoebic infection, Epidemiology, Human diseases.

The important factors in the epidemiology of hepatic amoebiasis in the district of Negombo, Ceylon, are: appropriate conditions for the transmission of amoebic infection as evidenced by inadequate sanitary facilities and pollution, together with poor surface drainage, and those which lead to a breakdown in the resistance of the individual, possibly an interaction between chronic alcoholism, inadequate diet, physical exertion and parasitic infestations. The prevalence of these factors appears to a large extent to be the cause of the high incidence of the syndrome in this part of Ceylon. All cases of hepatic amoebiasis were labeled as hepatic amoebiasis-with pus demonstrated and heptic amoebiasis-pus not demonstrated. This simplified classification was based on the observation that it is not possible to demarcate clinically by clear cut signs and symptoms the group of cases where pus may be demonstrated (hepatic abscesses) from the group of cases where pus may not be demonstrated (so called amoebic hepatitis). Laboratory investigations also appear to be of only relative value in differentiating these 2 groups. The only definite indication then, of the presence of an abscess would be either localization with external pointing or rupture. Elevation in the ESR (erythrocyte sedimentation rate) was a striking observation. A useful aid to diagnosis may be the triad, a leukocytosis, an elevated ESR and normal or only mildly elevated serum enzyme values.--Copyright 1973, Biological Abstracts, Inc.

LIFE HISTORY AND GROWTH INHIBITION STUDIES IN PLATYDORINA CAUDATA (VOLVOCACEAE),
Kentucky Univ., Lexington. Dept. of Botany.
D. O. Harris.
Research report (1972), 33 p. 4 tab., 23 ref. OWRR A-018-KY (4).

Descriptors: *Algal control, *Life history studies, *Plant growth substances, *Inhibitors, Cultures, Reproduction, Nitrogen, Phytotoxicity, Biochemistry, Algae, Plant physiology.
Identifiers: *Platydorina caudata, *Volvocaceae, Pandorina morum, Volvox tertius.

Platydornia caudata life history was studied in axenic culture. Asexual reproduction in Platydorina involves several successive cell divisions resulting in the formation of a curved plate or plakea which subsequently inverts to complete the process of daughter colonly formation. Factors which might control the sexual process were examined. Gametogenesis is dependent upon the concentration of nitrogen, and a complete sperm reaction occurs after the nitrogen supply has been depleted. Sperm differentiation is a linear response to nitrogen depletion. An autoinhibitory substance was obtained from culture filtrates in which death of the culture had occurred. Bioassay of the autoinhibitory substance was performed and specificity, liability, effects of freezing and bacterial contamination, and dialysis observed. It was also observed by studying many strains that a complex system of growth inhibition is operative in the family Volvocaceae. Pandorina morum produced the strongest inhibitor, inhibiting growth of most members of the family and Volvox tertius proved to be the most sensitive. These two genera were therefore used as a model system to study the chemical and physical properties of algal growth inhibitors. (Jones-Wisconsin)

COVER RESPONSE OF FISH IN BIOASSAY OF ACID WATER,
Pennsylvania State Univ., University Park.
J. K.Crawford, and R. L. Butler.
In: Fish and Food Organisms in Acid Mine Waters of Pennsylvania, Environmental Protection Agency, Ecological Research Series EPA-R3-73-032, February 1973. p 1-71, 25 fig, 14 tab, 44 ref. EPA Project 18050 DOG. WP-01539-01-(N)1.

Descriptors: *Fish behavior, *Bioassay, *Hydrogen ion concentration, *Acid mine water, Brook trout, *Pennsylvania, Bass, Laboratory tests, Water pollution effects, Water quality, Habitats, Streams.
Identifiers: *Cover utilization, Longnose dace.

Change in cover utilization and change in activity of fish as a behavioral bioassay were evaluated as to their reliability of a quality criteria for waters receiving acid mine drainage. Four species, cover-seekers and representatives of warm and cold water Pennsylvania streams were tested: smallmouth bass, rock bass, brook trout, and longnose dace. Methods were chosen that measured fish activity and response to cover with changes in pH. Natural unpolluted water, natural water acidified in the laboratory, diluted acid mine water, and treated acid mine water were used. Observations were made in a stream aquarium after a 100-hour period of acclimation to the test water (pH 7.0 through 4.0) and either 1/2 or 24-hour adjustment to the test area. Temperature, water velocity, and light periodicity were controlled. Analysis of variance revealed no relationship between cover utilization and pH levels or between activity and pH levels. Failure of cover utilization and activity to reflect changes in water quality conditions makes this bioassay technique as tested unsuitable for establishment of water quality criteria. EFFECTS OF ACID MINE DRAINAGE ON FISH POPULATIONS,
Pennsylvania State Univ., University Park.
E. L. Cooper, and C. C. Wagner.
In: Fish and Food Organisms in Acid Mine Waters of Pennsylvania, Environmental Protection Agency, Ecological Research Series EPA-R3-73-032, February 1973. p 73-124, 14 fig, 5 tab, 19 ref. EPA Project 18050 DOG. WP-01539-01-(N)1.

Descriptors: *Acid mine water, *Appalachian Mountain Region, *Fish populations, *Hydrogen ion concentration, Water pollution effects, *Pennsylvania, Water quality, Brook trout, Bass, Resistance, Acidity, Heavy metals, Toxicity, Shiners, Suckers, Rivers, Distribution, Tributaries, Ecological distribution, Speciation, Varieties.
Identifiers: Chain pickerel, Yellow perch, Pumpkinseed.

Effects of acid mine drainage on distribution of natural fish populations in Pennsylvania were investigated. Total acidity, pH, and probably heavy metals are all involved in the toxic action of mine acid drainage on fish populations. Concentrations

of metallic ions in these discharges were not measured but concurrent readings of pH as low as 4.5 and total acidity as low as 15 ppm are sufficient to account for the complete loss of fish populations at about 90% of the stations examined. Of 116 fish species found 10 species exhibited some tolerance to water contaminated with acid mine drainage, ranging from pH 4.6 to 5.5; however, most are unimportant as game. Reclamation of streams receiving acid mine drainage must be sufficient to maintain pH readings not less than 5.5 and a total mineral acidity not exceeding 5 ppm to assure a diverse and productive fish population. Toxicity of heavy metals will be largely avoided if suitable pH and acidity levels are maintained. There are sufficient native populations present in small isolated tributaries to restock most waters once they are properly reclaimed. (See also W73-11332) (Auen-Wisconsin)
W73-14902

ACUTE TOXICITY OF LOW PH TO AQUATIC INSECTS,
Pennsylvania State Univ., University Park.
W. G. Kimmel, and D. C. Hales.
In: Fish and Food Organisms in Acid Mine Waters of Pennsylvania, Environmental Protection Agency, Ecological Research Series EPA-R3-73-032, February 1973. p 125-158, 2 fig, 9 tab, 13 ref. EPA Project 18050 DOG. WP-01539-01 (N)1.

Descriptors: *Acid mine water, *Hydrogen ion concentration, *Aquatic insects, Streams, Bioassay, *Pennsylvania, Acidity, Alkalinity, Sulfates, Toxicity, Water pollution effects, Growth stages, Resistance, Mayflies, Stoneflies.
Identifiers: Nigronia fasciata, Pteronarcys proteus, Boyeria vinosa, Acroneuria lycorias.

The effect of acid mine effluent on the soft-water Pennsylvania streams and on the acute tolerance of five species of aquatic insects to the lowered pH induced by sulfuric acid were studied. Ephemoroptera (Stenonema species), Plecoptera (Acroneuria lycorias and Pteronarcys proteus), Odonata (Boyeria vinosa) and Megaloptera (Nigronia fasciata) were chosen for investigation as benthic fauna representatives. The five species were generally tolerant of short-term exposures to lowered pH levels. There is doubt that low pH alone accounts for the sparse insect fauna characteristic of streams polluted by mine effluent. Aquatic insects may be more sensitive to low pH during molting which may be a critical time for toxicant action thus an increased sensitivity to hydrogen ions during ecdysis could eliminate insects from streams at higher pH levels than their acute toxicity values would indicate. The 96-hour TLm of all five species and their occurrence in naturally acidic streams at pH values 4.0 and 5.0 indicate that they could survive pH 5.0. Apparently other substances acting alone or synergistically with hydrogen ions are responsible for the elimination of benthos in streams receiving mine drainage. THE ECOLOGY OF THE SOUTHERN CALIFORNIA BIGHT: IMPLICATIONS FOR WATER QUALITY MANAGEMENT.
Southern California Coastal Water Research Project, El Segundo.

Ref. No. SCCWRP TR104, 1973. 531 p, 152 fig, 140 tab, 270 ref. $15.00.

Descriptors: *Bibliographies, *Reviews, *California, Ecology, *Waste water disposal, Coasts, *Environmental effects, Water pollution sources, Water pollution effects, Water quality, Management.
Identifiers: *Southern California Bight.

A 3-year study of the ecology of southern California coastal waters indicated that some concern expressed over the possible harmful effects of municipal wastewater discharges is exaggerated. The study, (which consisted of a 557-entry literature review, laboratory and field programs, and predictive modeling) involved characterization of the general physical, chemical, and biological conditions in the nearshore waters as well as detailed examination of conditions near major wastewater outfalls. Sources of various substances (particulate materials, oil and grease, plant nutrients, trace metals, chlorinated hydrocarbons, etc.) were identified, and input magnitudes were estimated; the study revealed little or no justification for altering present municipal wastewater treatment or discharge practices with regard to the constituents examined, with the exception of floatable materials, highly toxic metals, and chlorinated gydrocarbons. In particular, inland wastewater treatment requirements (such as those relating to biochemical oxygen demand, suspended solids, and nutrients) were found to have little technical relevance to marine ecological problems. Other topics covered in the study (and recommended for further investigation) included diseases in nearshore fishes, indicator organisms, population and community interactions of benthic invertebrates and fishes, stimulatory and toxic effects of wastewater on phytoplankton and benthic organisms, and constituent inputs through industrial discharges, vessel-related activities, dredge spoil, surface runoff, aerial fallout, and advection.

KINETICS OF ORTHOPHOSPHATE UPTAKE BY PHYTOPLANKTON POPULATIONS IN LAKE WINNEBAGO,
Wisconsin Univ., Madison. Dept. of Botany.
S. Bartell, and S. Richman.
Trans Wis Acad Sci Arts Lett. 60: p 147-178. 1972. Illus.
Identifiers: Carbon, Chlorophyll, Equations, Kinetics, Lake, *Orthophosphates, *Phytoplankton, Primary production, *Wisconsin, *Lake Winnebago (Wis).

The growth of natural phytoplankton populations of Lake Winnebago, Wisconsin, was investigated with regard to orthophosphate limitation. An ascorbic acid-antimony modification of a standard molybdenum blue colorimetric test for orthophosphate showed a concentration of 94.0 microgram/l in late Nov., 1970. This concentration steadily decreased to a minimum of 29.0 microgram/l in early Feb., 1971. With the removal of ice cover and increased allochthonous addition of phosphate associated with the spring thaw, the orthophosphate concentration increased to 109.0 microgram/l in early April. A standard acetone extraction procedure showed that chlorophyll concentrations followed asimilar trend in seasonal variation. The 2.2 mg/m3 concentration found in the Jan. 9, 1971 sample decreased to a minimum of 0.4 mg/m3 for the Jan. 24 sample. The chlorophyll concentration gradually increased to 20.8 mg/m3 by early April. Primary productivity measured by a standard 14C technique, increase in biovolume determined by the Model B Coulter Counter and chlorophyll production were used to study the kinetics of orthophosphate uptake in enrichment experiments where varied amounts of orthophosphate, were added to samples of Lake Winnebago water. The resulting changes in the rates of these parameters suggest that uptake followed the Michaelis-Menten equation, modified for nutrient limitation theory for enriched samples collected on Feb. 2 and Feb. 20, 1971. This model may also apply to the Nov. and April populations; however, a limitation in experimental design prohibited the calculation of Vmax (maximum uptake rate) and Kt (transport constant ± substrate concentration at which uptake rate ± 1/2 Vmax). Orthophosphate was determined to be a limiting factor for productivity in Lake Winnebago over the winter months.--Copyright 1973, Biological Abstracts, Inc.

BEHAVIOR OF TRITIUM IN FISH FOLLOWING CHRONIC EXPOSURE,
Purdue Univ., Lafayette, Ind. Dept. of Bionucleonics.
T. J. Morgan, R. R. Landolt, and J. Hamelink.
In: Tritium, p 378-381, May 1973. 3 fig. Messenger Graphics, Phoenix, Arizona. Price: $35.00.

Descriptors: *Tritium, Radioactivity, *Fish behavior, Environment, Water pollution effects, Assay, Toxicity, Excretion, Bioassay, Biological communities, Hydrobiology, Biocontrol, Food chains, Absorption, *Channel catfish, Fish management.

The release of tritium from power reactors presents a need for evaluating the fate of this radionuclide in fish. This information is desirable, not only from the standpoint of game fishing, but particularly with regard to commercial fish farming. The growing of fish, such as channel catfish (Ictalurus punctatus), to edible sizes in cage culture systems is often done in natural bodies of water, and heated effluents from some power plants may be discharged into the waters of commercial fish farms. The information presented is the result of a preliminary evaluation of the uptake and elimination of tritium by fish grown in tritiated water. (Houser-ORNL)

THE DOSE TO MAN VIA FOOD-CHAIN TRANSFER RESULTING FROM EXPOSURE TO TRITIATED WATER VAPOR,
California Univ., Livermore. Lawrence Livermore Lab.
L. R. Anspaugh, J. J. Koranda, W. L. Robinson, and J. R. Martin.
In: Tritium, p 405-422, May 1973. 4 fig, 4 tab, 39 ref. Messenger Graphics, Phoenix, Arizona. Price: $35.00.

Descriptors: *Tritium, *Food chains, *Public health, *Water vapor, *Prediction, *Mathematical model, Air pollution effects, Toxicity, Radioactivity, Environment, Behavior, Ecology absorption, Vegetable crops, Milk.

The purpose is to provide a more accurate, but also a simple model to predict doses to man resulting from food-chain contamination due to exposure to tritiated water vapor. Knowledge concerning the environmental behavior of tritiated water was obtained during radioecology studies at Project Rulison and controlled exposures at Livermore which have been discussed by Koranda and Martin. The model is specifically directed to the prediction of dose from the release of tritiated water vapor from a point source, but most of the model is applicable to any tritiated water vapor exposure. Dose commitments via inhalation plus absorption and via the ingestion of vegetables, milk, and meat are considered. The model may be entered with a variety of input data; average values of the parameters needed to evaluate the model are provided, but other values more appropriate to a particular situation may be readily substituted. CONTAMINATION OF WATER BODIES AND BIOLOGICAL ASSESSMENT OF WATER QUALITY (ZAGRYAZNENIYE VODOYEMOV I BIOLOGICHESKAYA OTSENKA KACHESTVA VOD),
Moscow State Univ. (USSR).
N. S. Stroganov.
Vodnyye Resursy, No 2, p 34-52, 1972. 5 fig, 1 tab, 62 ref.

Descriptors: Water pollution, *Water pollution effects, *Water quality, Bodies of water, Biology, Biological communities, Ecosystems, Aquatic life, *Toxicity, Toxins, Surface waters.
Identifiers: USSR, *Hydrobionts, *Saprophytes.

Surface-water quality is affected by hydrobiont activity consistent with the hydrologic regime of water bodies. Examined are: (1) general reactions of hydrobionts to the effects of toxic substances; (2) diversity of species as an index of pollution; (3) importance of toxicity in the study of problems relating to degradation of the water medium; and (4) importance of a systems approach in assessing possible changes in biological processes and water quality resulting from the presence of toxic substances. Diversity of species is presently a much better biological index of water quality than either the presence or absence of certain species, although a determination of this index is time consuming and not altogether reliable. (Josefson-USGS)

THE ACCUMULATION OF ARSENIC FROM ARSENIC-RICH NATURAL WATERS BY AQUATIC PLANTS,
Department of Scientific and Industrial Research, Palmerston North (New Zealand). Applied Biochemistry Div.
P. F. Reay.
J Appl Ecol. Vol 9, No 2, p 557-565. 1972. Illus.
Identifiers: Accumulation, *Aquatic plants, *Arsenic, Bottoms, Lakes, *New Zealand (Waikato River), Rivers, Sea, Toxicity.

Several aquatic plants were found to accumulate As from the Waikato river (New Zealand) to levels well above those associated with toxicity. The species examined differed in the concentrations to which they acculated As and the average values ranged from 30-650 mg/kg of the dry weight. Accumulation was influenced by the amount of As in the water but not by the amount in the river and lake bottoms. The withdrawal of As from the river water by aquatic plants does not seem to markedly affect the discharge of As into the sea.--Copyright 1973, Biological Abstracts, Inc.

GROWTH, GAS VACUOLATION AND BUOYANCY IN A NATURAL POPULATION OF A PLANTONIC BLUE-GREEN ALGA,
Freshwater Biological Association, Shrewsbury (England). Meres Lab.
C. S. Reynolds.
Freshwater Biol. Vol 2, No 2, p 87-106. 1972. Illus.
Identifiers: Alga, Anabaena-Circinalis, Blooms, Buoyancy, *Eutrophication, *Gas vacuolation, Germination, Growth, Lakes, Phosphorus, Photosynthesis, Planktonic populations, Spore, Temperature, *Cyanophyta.

The growth and development of a natural population of Anabaena circinalis is described in relation to physical and chemical conditions within a small, shallow eutrophic lake. Germination of resting spores took place when the lake was destratified, in response to improving conditions of light and temperature. The growth of the population was monitored for chlorophyll and nutrient content, and parallel determinations of heterocyst ratio, gas vacuole volume, turgor and buoyancy were made. Growth of the population was probably limited by P deficiency. Cessation of growth was marked by increases in gas vacuole volume and buoyancy. Gas vacuole volume is determined primarily by the rate of increase of the alga. It is modified by turgor changes, associated with photosynthetic rates. Surface blooms are the result of the redistribution of buoyant algae when turbulence currents are weak. Buoyancy is increased in algae lodged at the surface.--Copyright 1973, Biological Abstracts, Inc.

NITRATE REDUCTASE ACTIVITY DURING A DINOFLAGELLATE BLOOM,
North Carolina State Univ., Raleigh. Dept. of Zoology.
W. G. Harrison.
Limnology and Oceanography, Vol 18, No 3, p 457-465, May 1973. 5 fig, 1 tab, 13 ref.

Descriptors: *Nutrients, *Growth rates, *Biomass, *Water quality, Dominant organisms, Phytoplankton, Enzymes, Nitrates, Nitrites, Ammonia, Water temperature, Phosphates, Limiting factors, Salinity, Metabolism, Water pollution effects, North Carolina.
Identifiers: *Nitrate reductase, *Peridinium triquetrum, Sample preparation, Pamlico River.

Samples of water and plankton were collected from the Pamlico River for measurement of ammonia, nitrate, nitrite, and phosphate contents, nitrate reductase (NR) activity, and phytoplankton population. Water temperature and salinity were also determined. The purpose was to determine what conditions gave rise to winter dinoflagellate (Peridinium triquetrum) blooms. NR activity was determined by filtering samples through a glass fiber filter, grinding the filter with a Teflon-glass homogenizer in phosphate buffer and dithiothreitol, and centrifuging the crude enzyme extract out. This extract was incubated for 45 min. with NADH and the NR activity calculated as the amount of nitrite formed. NR activity paralleled the development of a winter dinoflagellate bloom. High enzyme activity was associated not only with high algal biomass, primarily of Peridinium triquetrum, but also with low nitrate concentrations in the typically nitrate-rich waters. Nitrate was an important source of nitrogen for the bloom organisms in spite of the abundance of ammonium. The initiation and cessation of nitrate assimilation seemed closely related to the appearance and disappearance of the bloom. Although nitrate metabolism may be an important factor in bloom timing, temperature, salinity, and flushing of the system are also involved. (Little-Battelle)

Identifiers: *Goldfish, Pollutant effects, Carassius auratus, Recovery, p p' DDT, Data interpretation, Chemical concentration, Neurogenicity.

When they are introduced into a novel environment, normal goldfish display a highly specific nonrandom exploratory behavior. It consists of a systematic spatial and temporal distribution of activity that in the light of its complexity is assumed to be under the control of the central nervous system. Fourteen goldfish were used to investigate such exploratory behavior as influenced by exposures to subacute concentrations of DDT. The fish were kept individually in fiberglass tanks in 100 l of stagnant aerated water at a mean temperature of 21C. Locomotor behavior was monitored over a 20-hour period before treatment and again 4 days later after exposures which were continuous. Once every 24 hr each fish was transferred to a clean tank containing a 10 micrograms/l concentration of p,p'-DDT. Aspects of this exploratory behavior were significantly affected by chronic exposure to DDT (10 micrograms/l p,p'-DDT for 4 days), and thus earlier suggestions in the literature that the pesticide may affect functions controlled by the central nervous system were reinforced. The maintenance of the fish for 20 hours in laboratory water following exposure to DDT resulted in a decrease in the described DDT effect. (Holoman-Battelle)

Water Research, Vol 7, No 6, p 929-941, June 1973. 2 tab, 99 ref.

Descriptors: *Odor, *Taste, *Phenols, *Fish, *Toxicity, *Water quality standards, Algae, Bacteria, Protozoa, Crustaceans, Mollusks, Industrial wastes, Dissolved oxygen, Water pollution effects, Salinity, Water temperature, *Reviews, Water quality, Cyanides, Domestic wastes, Animal wastes (Wildlife), Rainbow trout, Carp, Hydrogen ion concentration, Hardness (Water), Chlorination, Brown trout, Perches, Sunfishes, Pikes, Freshwater fish, Eels, Fishkill, Waterfleas, Shrimp, Snails, Mayflies, Mosquitoes, Midges, Copepods, Isopods, Amphipoda, Rotifers, Organic acids, Caddisflies, Sticklebacks, Alcohols.
Identifiers: Cresols, Xylenols, Aldehydes, Pyrocatechol, Resorcinol, Hydroquinone, Guaiacol, Naphthols, Aniline, Quinols, Monohydric phenols, Dihydric phenols, Polyhydric phenols, Coke, Oil refineries, Livestock dip, Catechols, Crucian carp, Fathead minnow, Mosquitofish, Coho salmon, Sturgeon, Tench, Bream, Britterling, Gudgeon, Roach, Rudd, Guppy, Gas liquor, Grayling, Chub, Barbel, Bluntnose minnow, Green sunfish, Chlorinated hydrocarbons, Ostracods, Goldfish, Chlorophenols, Brown bullhead.

Review of the literature concerning the occurrence and effects of phenols in the aquatic environment shows that phenolic wastes can contain monohydric phenols, including phenol, the three cresol isomers, and the six xylenol isomers, together with other substances. They may adversely affect freshwater fisheries by their direct toxicity to fish and fish-food organisms, by their high oxygen demand resulting in oxygen depletion of the receiving water, and by the production of undesirable flavors in the edible flesh of fish. Laboratory tests show that the toxicity of phenol is increased by decrease in dissolved-oxygen concentration, increase in salinity, and decrease in temperature. Salmonids and newly hatched fish are more sensitive than coarse fish and adults, respectively. Cresols, xylenols, and phenols are of similar toxicity, and the toxicity of mixtures of phenols is apparently additive, although the toxicity of phenolic wastes may be greater than expected from chemical analyses, since these may not be equally sensitive to all phenols and may neglect the contribution from other poisons. Because of difficulties caused by inadequate chemical analysis there are few field observations which can be used to reinforce laboratory findings. For this reason, and also because of gaps in knowledge of the effect of temperature on toxicity, only tentative criteria can be established, which may have to be modified in the light of further experience. These criteria are expressed as maximum concentrations which should not be exceeded but it should be appreciated that because of the natural fluctuation in the water quality found in rivers over a period of time, the average concentration will be lower to an extent depending on local circumstances. Maximum permissible levels for salmonids, coarse fish, and commercial fisheries are given. (Little-Battelle)

EXPOSURE OF DOGFISH SHARK FETI TO MERCURY,
Oregon State Univ , Astoria Sea Food Lab
E A. Childs, J N Gaffke, and D L. Crawford
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 5, p 276-280, May 1973 2 tab, 12 ref.

Descriptors: *Mercury, *Pollutant identification, *Water pollution effects, Chemical analysis, Marine fish, Path of pollutants, Heavy metals, Sharks, Embroyonic growth stage, Marine animals.
Identifiers: *Pacific spiny dogfish, *Fetus, *Bioaccumulation, Animal tissues, Flameless atomic absorption spectrophotometry, Sample preparation, Squalus suckleyi.

The relationship of maternal mercury load to fetal mercury load was examined in the Pacific spiny dogfish shark (Squalus suckleyi). S. suckleyi samples from the continental shelf adjacent to the North Oregon coast were homogenized and digested in 4 volumes of 1:1 (v/v) concentrated nitric and sulfuric acid. After digestion 3-5 drops of hydrogen peroxide were added followed by deionized water. The amount of mercury was determined by flameless atomic absorption spectrophotometry. Total mineral content, and the protein and lipid content of follicle and maternal samples were determined. The level of mercury in the fetus was significantly lower than in the mother. Maternal muscle samples had a mean mercury content of 0.66 ppm with a range of 0.332 - 0.999 ppm. There was no apparent relationship between the concentrations of mercury in the fetus and mother. Regardless of the concentration of mercury in the maternal tissue, no fetal sample taken from undamaged uteri contained greater than 0.058 ppm mercury, and no follicle greater than 0.119 ppm mercury. These data clearly demonstrate that mercury is not concentrated in S. suckleyi feti in situ. Follicle and fetal stages had an equal or higher ash content than did the maternal tissue which indicates that there is no general inhibition of movement of minerals into the fetus. The data show that mercury is uniquely absent from the fetal environment, and suggest that it may be selectively excluded. (Holoman-Battelle)

COMPARISON OF THE METABOLISM OF PARATHION BY LOBSTERS AND RATS,
Rhode Island Univ., Kingston. Coll. of Pharmacy.
G. P. Carlson.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 5, p 296-300, May 1973. 2 tab, 13 ref.

Descriptors: *Animal metabolism, *Pesticide toxicity, *Bioassay, *Lobsters, Phosphothioate pesticides, Organophosphorus pesticides, Insecticides, Laboratory tests, Crustaceans, Lethal limit, Small animals (Mammals).
Identifiers: *Parathion, *Rats, *Fate of pollutants, Pollutant effects, Median tolerance limit, Metabolites, p-Nitrophenol, Paraoxon, Data interpretation, Animal tissues, Liver, Hepatopancreas, Biotransformation.

Adult male rats and male lobsters were exposed to parathion in a comparative acute toxicity and metabolic study of this organophosphorus pesticide. To test acute lethality to lobsters, various doses of parathion were injected into the cheliped sinuses of the lobsters after which the individuals were maintained in artificial aerated seawater at 13C for 48 hr. Prepared homogenates of rat livers

and lobster hepatopancreases were used to study the metabolism of parathion to p-nitrophenol. Microsomal fractions were used to study the metabolism of parathion to paraoxon. An approximate LD sub 50 of 0.3 mg/kg was obtained for the lobsters. Preliminary experiments on the conversion of parathion to paraoxon indicated that initial incubation of tissue containing 0.2 to 0.5 mg protein resulted in paraoxon concentrations which could be measured by acetylcholinesterase inhibition. In the case of lobsters, no paraoxon formation could be detected even though up to 12.2 mg microsomal protein were employed. It was readily apparent that rats metabolize parathion (either directly or after transformation into paraoxon) to p-nitrophenol several times faster in vitro than do lobsters. When the temperature of incubation was decreased to 20C there was a dignificant decrease in activity in the rats but a significant increase in activity in the lobsters. (Holoman-Battelle)

RESIDUES OF MIREX IN CHANNEL CATFISH AND OTHER AQUATIC ORGANISMS,
Animal and Plant Health Inspection Service, Gulfport, Miss.
H. L. Collins, J. R. Davis, and G. P. Markin.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 2, p 73-77, August 1973. 1 tab, 12 ref.

Descriptors: *Pesticide residues, *Fish farming, *Bioassay, *Channel catfish, Dragonflies, Crayfish, Water pollution effects, Toxicity, Freshwater fish, Absorption, Minnows, Food chains, Public health, Chlorinated hydrocarbon pesticides, Path of pollutants.
Identifiers: *Bioaccumulation, *Mirex, Cricket frog, Mosquitofish, Tadpoles, Biological samples, Macroinvertebrates, Sample preparation, Gas liquid chromatography.

The use of mirex to control fire ants in areas of catfish farming has caused concern about the possible accumulation of the pesticide in fish. To study the effects of mirex treatment, a pond 3.5 feet deep containing caged and uncaged channel catfish (Ictalurus punctatus), minnows (Opsopoeodus emiliae), mosquitofish (Gambusia affinis), cricket frogs (Acris gryllus), tadpoles, crayfish (Cambarellus shufeldti), and dragonfly nymphs and the surrounding area were treated with mirex at a rate of 1.25 lbs/acre. Mortality of fish in cages was assessed, and residues of mirex were determined by gas liquid chromatography of composited whole body samples of each species. Samples were prepared by grinding in a mortar and pestle, extracting with hexane, and concentrating by heating and distillation. Observation of fish for 6 months after the treatment showed no mortality, deformities, or ill effects on caged fish. Uncaged catfish gradually built up residues of mirex to a maximum level of 0.65 ppm after 6 months. After 16 months, the concentration was 0.44 ppm. Caged fish, however, contained no detectable residues apparently because the catfish did not feed directly on the pesticide, but rather accumulated it through the food chain. All other organisms analyzed contained residues which in most cases were still detectable after 16 months. It is concluded that treatment of areas of catfish farming with mirex poses no hazard since the fish are fed artificial food and therefore will not feed on organisms containing residues. (Little-Battelle)

ORAL TOXICITY OF CHLORINATED DIBENZOFURANS TO JUVENILE ATLANTIC SALMON,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
V. Zitko, and P. M. K. Choi.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 2, p 120-122, August 1973. 1 tab, 5 ref.

Descriptors: *Atlantic salmon, *Toxicity, *Juvenile fish, Cold-water fish, Chemical analysis, Path of pollutants, Mortality, Polychlorinated biphenyls, Foods, Lethal limit, Bioassay.
Identifiers: Dichlorodibenzofuran, Trichlorodibenzofuran, Tetrachlorodibenzofuran, Octachlorodibenzofuran, *Bioaccumulation, Salmo salar, *Chlorinated dibenzofurnas, Animal tissues, Muscle, Intestine, Biological magnification.

Dry fish food was spiked with di-, tri-, tetra-, and octachlorodibenzofuran and fed several times a day to juvenile Atlantic salmon kept in a fiberglass tank in running water at 10 C and a 16-h light, 8-h dark photoperiod. The method of Zitko (1972) was used to analyze the fish food and the muscle and gut of fish that died between the 81st and 135th day of the experiment, and of fish surviving for 140 days. The median mortality of 120 plus or minus 30 days occurred among the fish fed the spiked food. Di-, tri-, and tetrachlorodibenzofuran were not detectable in any of the samples. The dead fish contained about 10 times higher concentration of octachlorodibenzofuran in the gut and 3 times higher concentration in the muscle than the fish alive after 140 days. The observed levels of octachlorodibenzofuran may be only a measure of the amount of ingested food, not associated with the toxic effects. The presented data indicate that in fish, as well as mammals, chlorinated dibenzofurans are much more toxic than PCB. The results indicate that because of the high toxicity and low residual levels of chlorinated dibenzofurans, a more sensitive analytical method is required. (Holoman-Battelle)

THE ACUTE TOXICITY OF A YELLOW PHOSPHORUS CONTAMINATED DIET TO BROOK TROUT (SALVELINUS FONTINALIS),
Memorial Univ. of Newfoundland, St. John's.
G. L. Fletcher.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 2, p 123-128, August 1973. 2 tab, 9 ref.

Descriptors: *Toxicity, *Lethal limit, *Brook trout, *Fish diets, *Bioassay, Phosphorus, Freshwater fish, Poisons, Laboratory tests, Chemical analysis, Cold-water fish.
Identifiers: *Yellow phosphorus, Pollutant effects, Salvelinus fontinalis, Cod (Fish), Hemolysis, Bioaccumulation, Hematocrit, Animal tissues, Muscle, Liver, Chemical concentration, Median tolerance limit.

An experiment is described which shows that yellow phosphorus contaminated cod muscle and liver tissues are lethal when consumed by brook trout. Yearling brook trout were divided into four experimental groups, each of which was fed a maximum of 18 g of tissue per day. Each fish was removed from its tank when dead, and a hematocrit was obtained from a caudal blood vessel. The concentration of yellow phosphorus in the cod and trout tissues was determined by gas-liquid chromatography. The yellow phosphorus concentration of the liver fed the trout was 194 micrograms/g and the muscle contained 4-11 micrograms/g. The LT sub 50 for those trout fed phossy liver was 600 hr and for those fed phossy muscle, 1400 hr. At death the hematocrits of the phossy liver fed trout were significantly lower and the livers were larger than those of the controls. Yellow phosphorus was only detectable in the first two trout to die (216 and 240 hours). The average concentrations (microgram/g) found were as follows; intestinal contents 0.28, brain 0.33, spleen 0.25, muscle 0.13, liver 0.02. At death, the hematocrits of the phossy muscle fed trout were significantly greater than those of the control trout. Yellow phosphorus was not detectable (less than 0.002 microgram/gm) in any of the trout tissues. The symptoms of P4 poisoning were identical to those observed when this element is present in water (FLETCHER et al. 1970), namely, external redness, hemolysis and reduced hematocrits. The approximate toxic dosage of P4 ranged from 1.23-2.73 mg. (Holoman-Battelle)

ABSENCE OF ACUTE EFFECTS ON THREESPINE STICKLEBACKS (GASTEROSTEUS ACULEATUS) AND COHO SALMON (ONCORHYNCHUS KISUTCH) EXPOSED TO RESUSPENDED HARBOR SEDIMENT CONTAMINANTS,
Washington Univ., Seattle. Coll. of Fisheries.
R. S. LeGorge, and D. M. DesVoigne.
Journal of the Fisheries Research Board of Canada, Vol 30, No 8, p 1240-1242, August 1973. 1 fig, 2 tab, 5 ref.

Descriptors: *Bioassay, *Water pollution effects, *Coho salmon, *Soil contamination, Fish behavior, Chemical oxygen demand, Zinc, Lead, Marine fish, Oil, Suspended solids, Fry, Laboratory tests, *Washington.
Identifiers: *Stickleback, *Suspended sediments, Gasterosteus aculeatus, Volatile solids, Grease, Organic nitrogen, Duwamish Waterway (Wash), Oncorhynchus kisutch.

Threespine sticklebacks (Gasterosteus aculeatus) and coho salmon fry (Oncorhynchus kisutch) were challenged in static 96-hr bioassays with suspensions of sediment from the Duwamish Waterway, Seattle, Wash. Ten test fish per 10-gal aquarium were starved for the duration of the acclimation period (72 hr) and for the 96-hr experimental periods. Doses of up to 5 percent wet weight (28.8 g/liter dry weight basis) were used. The criterion of effect on the fish was loss of equilibrium; aquaria were checked at 3, 6, 12, 24, 36, 48, 72, and 96 hr. No observable effect on the fish of contaminants released from the sediment was elicited, although high levels of those contaminants, such as volatile solids, COD, organic nitrogen, oil and grease, zinc, and lead, were present. (Holoman-Battele)

TOXICITY OF TFM (LAMPRICIDE) TO SIX EARLY LIFE STAGES OF RAINBOW TROUT (SALMO GAIRDNERI),
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
L. E. Olson, and L. L. Marking.
Journal of the Fisheries Research Board of Canada, Vol 30, No 8, p 1047-1052, August 1973. 1 fig, 1 tab, 18 ref.

Descriptors: Water pollution effects, *Rainbow trout, *Growth stages, *Pesticide toxicity, *Fish control agents, *Bioassay, Fish repellents, Fish physiology, Piscicides, Phenolic pesticides, Halogenated pesticides, Laboratory tests, Lethal limit, Fish eggs, Fry, Juvenile fish, Hardness (Water), Resistance, Freshwater fish, Cold-water fish.
Identifiers: *TFM, *Lampricides, Pollutant effects, Median tolerance limit.

The lampricide TFM (3-trifluoromethyl-4-nitrophenol) was tested against the following life stages of rainbow trout (Salmo gairdneri): green eggs, eyed eggs, sac fry, swim-up fry, fry, and fingerlings in four water hardnesses (12, 44, 170, and 320 mg/liter as CaCO3). The eyed egg stage was one of the most resistant stages tested, and the sac-fry stage was one of the least resistant. Increased water hardness decreases toxicity to all stages. The LC50's range from 0.532 mg/liter to 40.0 mg/liter depending upon life stage, water hardness, and duration of exposure. The margin of safety for coexisting species exposed to TFM ranges from 3.2 to 4.1 in natural waters. The margin of safety for early life stages of rainbow trout and larval lamprey under controlled laboratory conditions ranges from 4.2 to 12.2. Therefore, all six early life stages of rainbow trout are safe in

minimum lampricidal concentrations of TFM. (Holoman-Battelle)

TEMPERATURE SELECTION OF ATLANTIC SALMON (SALMO SALAR) AND BROOK TROUT (SALVELINUS FONTINALIS) AS INFLUENCED BY VARIOUS CHLORINATED HYDROCARBONS,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
R. H. Peterson.
Journal of the Fisheries Research Board of Canada, Vol 30, No 8, p 1091-1097, August 1973. 4 fig, 2 tab, 14 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Atlantic salmon, *Brook trout, *Polychlorinated biphenyls, *Fish behavior, *Bioassay, *Juvenile fish, Water pollution effects, Water temperature, DDT, DDD, DDE, Freshwater fish, Pesticide toxicity, Aldrin, Thermocline, Laboratory tests.
Identifiers: *Temperature selection (Trout), Isomers, Data interpretation, Metabolites, DDA, Methoxychlor, Aroclor 1254, p p' DDT, o p' DDT, p p' DDD, p p' DDA, p p'-Dichlorobenzophenone.

Data are presented which describe the effects of several compounds structurally related to DDT and of two other chlorinated hydrocarbons (aldrin and a PCB preparation) on temperature selection by juvenile Atlantic salmon (Salmo salar) in a horizontal temperature gradient. The effects of p,p'-DDT and p,p'-DDD on temperature selection of underyearling brook trout (Salvelinus fontinalis) in a vertical gradient are also presented. The effects of previous exposure to p,p'-DDT, o,p'-DDT, p,p'-DDD, p,p'-DDE, and methoxychlor on temperature selection by juvenile Atlantic salmon in a horizontal temperature gradient were similar. Exposure to low concentrations resulted in no change or a decrease in selected temperatures as compared to control values of about 16 C. Exposure to higher concentrations raised selected temperatures. The concentrations of the substances required to produce a given effect varied as: p,p'-DDT greater than or equal to p,p'-DDD greater than methoxychlor greater than o,p'-DDT greater than p,p'-DDE. Exposure levels of p,p'-DDA less than or equal to 8 ppm did not alter temperature selection nor did exposure to Aroclor 1254, a polychlorinated biphenyl (PCB) preparation at 2 ppm. Aldrin lowered temperature selection at 0.1-0.15 ppm. In a vertical gradient, brook trout previously exposed to p,p'-DDT and p,p'-DDD selected higher temperatures than controls. (Holoman-Battelle)

BEHAVIOR OF THE PLANKTONIC COELENTERATES, SARSIA TUBULOSA, PHIALIDIUM GREGARIUM, AND PIEUROBRACHIA PILEUS IN SALINITY DISCONTINUITY LAYERS,
Fisheries Research Board of Canada, Nanaimo (British Columbia). Biological Station.
M. N. Arai.

Descriptors: *Zooplankton, Marine animals, *Animal behavior, *Environmental effects, Invertebrates, Salinity, Swimming, Fishing, Floating, Sea water.
Identifiers: *Coelenterates, *Ctenophora, *Salinity discontinuity layers, Hydrozoans, Sarsia tubulosa, Phialidium gregarium, Pleurobrachia pileus, Macroinvertebrates.

The behavior of Sarsia tubulosa (M. Sars 1835), Phialidium gregarium (L. Agassiz 1862), and Pleurobrachia pileus (O. F. Muller 1776) was investigated in chambers where salinity discontinuity layers could be established. Sarsia tubulosa and P. pileus aggregated at the layer for salinity discontinuities of as little as 0.2 percent although P. gregarium showed more variable behavior. This aggregation was shown to be due to an active response rather than passive flotation in the density barrier set up when low salinity water is placed over high salinity water. Sarsia tubulosa also showed increased fishing activity in any column containing a discontinuity layer compared with any homogeneous control column. (Holoman-Battelle)

EFFECT ON LIME NEUTRALIZED IRON HYDROXIDE SUSPENSIONS ON SURVIVAL, GROWTH, AND REPRODUCTION OF THE FATHEAD MINNOW (PIMEPHALES PROMELAS),
Pittsburgh Univ., Pa. Graduate School of Public Health.
E. J. Smith, J. L. Sykora, and M. A. Shapiro.
Journal of the Fisheries Research Board of Canada, Vol 30, No 8, p 1147-1153, August 1973. 1 fig, 5 tab, 10 ref.

Descriptors: *Fish reproduction, *Animal growth, Water pollution effects, *Laboratory tests, Freshwater fish, Mortality, Bioassay, Iron, Hardness (Water), Turbidity, Conductivity, *Minnows, *Iron compounds.
Identifiers: *Iron hydroxide, Survival, *Fathead minnow, Iron hydroxide, Pimephales promelas, Hatchability.

The long-term effect of lime neutralized suspended iron on fathead minnow (Pimephales promelas) survival, growth, and reproduction was assessed in a flow-through environment with a modified proportional diluter. Results of 12 months of testing reveal lower survival and declining growth of fathead minnows with an increase in lime neutralized suspended iron concentration. Hatchability and growth of fathead minnows were appreciably reduced in the lowest insoluble iron concentration tested, 1.5 mg Fe/liter. Reduced hatchability was attributed to the higher percentage of smaller particles in low lime neutralized iron concentrations. A comparison of data on survival, growth, and hatchability indicates that the safe level of suspended iron for fathead minnows presumably lies between the control and 1.5 mg Fe/liter. (Holoman-Battelle)
W73-15099

VULNERABILITY AND SURVIVAL OF YOUNG CONNECTICUT RIVER FISH ENTRAINED AT A NUCLEAR POWER PLANT,
Essex Marine Lab., Conn.
B. C. Marcy, Jr.
Journal of the Fisheries Research Board of Canada, Vol 30, No 8, p 1195-1203, August 1973. 2 fig, 4 tab, 13 ref.

Descriptors: Freshwater fish, *Connecticut River, *Nuclear powerplants, *Entrainment, Condensers, *Thermal stress, *Cooling towers, Mortality, Intakes, White perch, Carp, Cooling water, Heated water, Environmental effects, Water pollution effects, Larvae, Juvenile fish, Darters, Herrings, Discharge (Water), Outlets, Sea basses, Eels, Shiners, Catfishes, Water sampling, Water temperature, Weirs, *Thermal pollution.
Identifiers: Survival, *Biocides, Mechanical damage, Johnny darter, American eel, Blueback herring, White catfish, Spottail shiner, American shad, Discharge canals, Sodium hypochlorite, Alosa sapidissima, Etheostoma nigrum, Anguilla rostrata, Alewife, Alosa pseudoharengus, Alosa aestivalis, Cyprinus carpio, Ictalurus catus, Notropis hudsonius.

Those mechanical, biocidal, and thermal factors have been studied which influence the survival of fish during passage through the condenser and discharge canal system of the Connecticut Yankee nuclear powerplant. As the river passes the plant, a proportion of its living nonscreenable young fish population is entrained at the plant's intake. Samples were taken 50 m upstream or downstream of the intake on ebb or slack tide and the number of larvae and early juvenile fish per cubic meter of water was calculated as well as percentage of young living fish entrained. Survival in the discharge canal in relation to heat was determined from plankton net collections of larvae and early juvenile fishes at the plant's intake, below the outfall weir, and along the discharge canal at 457, 1200, and 1800 m. Other calculations made were of the: (1) percentages of mortality caused by mechanical damage when all intake pumps were running at capacity with no addition of heat or hypochlorite; and (2) percentage of mortality due to the injection of sodium hypochlorite, while all intake pumps were running and no heat was added. Most of the young fish of nine species that were entrained in the condenser cooling-water system were dead by the time they reached the lower end of the plant's 1.83-km (1.14 mile) long discharge canal. Sampling during June and July, when 95 percent of the nonscreenable fish were abundant near the plant's intake, showed that approximately 80 percent of the mortality in the canal was caused by mechanical damage and 20 percent was attributed to heat shock and prolonged exposure to temperatures elevated above 28 C. There was no measurable mortality due to the injection of sodium hypochlorite into the system as a biocide. The number of nonscreenable living fish entrained at the intake averaged about 4 percent (range 1.7-5.8 percent) of those passing by the plant under conditions of unidirectional net tidal flow. GROWTH TEMPERATURE REQUIREMENTS AND LOWER LETHAL TEMPERATURES FOR JUVENILE SMALLMOUTH BASS (MICROPTERUS DOLOMIEUI),
National Water Quality Lab., Cincinnati, Ohio. Newton Fish Toxicology Lab.
W. B. Horning, II, and R. E. Pearson.
Journal of the Fisheries Research Board of Canada, Vol 30, No 8, p 1226-1230, August 1973. 2 tab, 8 ref.

Descriptors: *Juvenile fish, *Growth rates, *Water temperature, *Heat resistance, *Cold resistance, Animal growth, Lethal limit, Mortality, Freshwater fish, Fish diseases, Environmental effects, *Bass.
Identifiers: Median tolerance limit, Growth requirements, Micropterus dolomieui, Growth studies.

Maximum growth rate of juvenile smallmouth bass (Micropterus dolomieui), grown at constant temperatures of 16, 23, 26, 29, 32, and 35 C, occurred at approximately 26 C. Fish held at 35 C demonstrated a negative growth rate. The average 96-hr low temperature TL sub 50 values (median tolerance limit) varied from 1.6 to 10.1 C for smallmouth bass acclimated to 15 and 26 C, respectively. Intermediate values were obtained for acclimated to 18 to 22 C. An important aspect of the study was the occurrence of a secondary fungous infection on the fish after 96-hr exposure to cold temperatures. In some cases the infection was severe enough to cause complete mortality within 7 days. (Holoman-Battelle)

YOLK-SAC MALFORMATION IN PACIFIC SALMON IN RELATION TO SUBSTRATE, TEMPERATURE, AND WATER VELOCITY,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
H. Emadi.
Journal of the Fisheries Research Board of Canada, Vol 30, No 8, p 1249-1250, August 1973. 1 fig, 1 tab, 7 ref.

Descriptors: *Environmental effects, *Salmon, Chum salmon, Pink salmon, Sockeye salmon, Chinook salmon, Coho salmon, Embryonic

growth stage, Water temperature, Animal growth, Juvenile fish, Fish eggs, Gravels, Fish physiology, Velocity.
Identifiers: *Alevins, *Pacific salmon, *Teratogenicity, Yolk sac, *Embryonic development, Water velocity, Substrates, Oncorhynchus keta, Oncorhynchus gorbuscha, Oncorhynchus nerka, Oncorhynchus tshawytscha, Oncorhynchus kisutch, Hybrids.

Results are reported for the studies of yolk-sac malformation in five species of Pacific salmon and two salmon hybrids to clarify the possible roles of substrate, water temperature, and water velocity in frequency of occurrence of the condition. Chum (Oncorhynchus keta), pink (O. gorbuscha), sockeye (O. nerka), and hybrid (pink x chinook) salmon alevins were susceptible to yolk-sac malformation when provided a smooth substrate as in standard hatchery incubators, at 12 C and a water velocity of 100 cm/hr. Chinook (O. tshawytscha) and coho (O. kisutch) alevins were not susceptible. In sockeye, malformations increased with increase in temperature from 8 to 12 and 14 C and, at 14 but not at 12 C, with increase in water velocity from 25 to 400 cm/hr. Replacement of the smooth substrate with a rough (gravel) substrate usually prevented the condition. (Holoman-Battelle)

Identifiers: Ion selective electrodes, Macroinvertebrates, Chironomids, Mesenchytraeus, Kincaidiana freidris, Biting midges, *Mason Bog (Calif).

The objectives were to measure diel and seasonal changes in oxygen saturation, water temperature, water level, and aerobic limit in a Sierra Nevada peatland, and to study invertebrate migration in response to the diel changes. Oxygen saturation, determined with an oxygen electrode at 2 cm, varied from a mid-afternoon minimum (35-44 percent) to a maximum before sunrise (83-96 percent), especially in July and August. This finding has not been previously reported for peatlands. Aerobic limit was determined from redwood stakes that were stained when oxygen was absent. Minimum aerobic limit occurred in July (4.8 cm plus or minus 0.43 cm) and maximum (18.8 cm plus or minus 1.48 cm) occurred in November. The seasonal change in aerobic limit was not related to water levels since the water table was at the surface each day. Organisms were extracted from peat collected at 6-hour intervals by placing cores in funnels which were flooded with water and connected to Erlenmeyer flasks. As the cores were heated by lights above the funnel, the organisms moved down into the flask. Dipterans (Chironomidae and Heleidae) showed no change in vertical distribution over a 24-hr period, but oligochaetes appeared to have a diel migration. Oligochaete vertical distribution was negatively correlated with surface water temperature. (Little-Battelle)

GROWTH AND TOXICITY TESTS ON THE MARINE NANOPLANKTONIC ALGA PLATYMONAS TETRATHELE G.S. WEST IN THE PRESENCE OF CRUDE OIL AND EMULSIFIERS,
Brussels Univ. (Belgium). Laboratorium voor Ekologie en Systematiek.
F. Mommaerts-Billiet.
Environmental Pollution, Vol 4, No 4, p 261-282, June 1973. 11 fig, 2 tab, 16 ref.

Descriptors: Water pollution effects, *Phytoplankton, *Plant growth, Plant morphology, *Chlorophyta, Laboratory tests, *Phytotoxicity, Marine algae, Bioassay, Cytological studies, Nannoplankton, Environmental effects, Electron microscopy, *Emulsifiers, Protozoa, Growth rates, Oil pollution, Toxicity, Mortality, Plant physiology.
Identifiers: *Crude oil, *Platymonas tetrathele, Nonionic emulsifers, Finasol SC, Finasol OSR1, Flagellates, Libyan crude oil, Mixtures, Weathered crude oil, Oil dispersants.

The nanoplanktonic flagellate Playmonas tetrathele was used as a test organism in determining the response of phytoplankton to environmental pollution by crude oil and industrial non-ionic emulsifiers. Pure products and various mixtures were added to fresh media just before subculturing from a stock culture of Platymonas. The concentrations used were 5, 10, 25, 50, 100, 250 and 500 ppm; there was no duplication of cultures. In a second experiment all tests were made at 100 ppm with triplicate cultures. Cultures poisoned with an emulsifier in an aromatic solvent exhibited a very long lag phase. Diminished growth rates were observed for all the products tested most of the time at concentrations above 50 ppm. The mixture showed a toxicity close to that of the emulsifier component at its concentration in the mixture and lower than that of the crude oil alone. Recovery of Platymonas cells was observed at all tested concentrations. Electron micrography of Platymonas cells of cultures polluted by emulsifier SC and by the mixture crude plus emulsifier SC have shown that, compared with controls, the surviving cells did not present any anatomical abnormality in the organelles or in the membranes. However, a long-term exposure to pollutants in the non-lethal range could induce irreversible modifications in the morphology or the physiology of the phytoplankton cells, or even induce mutations. On the other hand, the great variety of synthetic products dumped in the sea may cause more resistant forms to be selected. (Holoman-Battelle)

INFLUENCE OF MACRO-NUTRIENTS ON THE RELATIVE GROWTH OF WATER PLANTS IN THE QU'APPELLE LAKES,
Saskatchewan Univ., Regina. Dept. of Biology.
G. Jones, and D. R. Cullimore.
Environmental Pollution, Vol 4, No 4, p 283-290, June 1973. 2 fig, 4 tab, 12 ref.

Descriptors: Aquatic plants, *Submerged plants, *Phosphates, *Dominant organisms, *Canada, *Ecological distribution, Water quality, Environmental effects, *Nutrients, *Plant growth, Sago pondweed, Aquatic weeds, Water chemistry, Lake sediments, Water properties, Pondweeds, Carbon, Chemical analysis, Soil analysis, Water analysis, Cheical properties, Hardness (Water), Biological properties, Speciation.
Identifiers: *Qu'Appelle Lakes, *Macrophytes, Hornwort, American milfoil, Buffalo Pound Lake, Last Mountain Lake, Pasqua Lake, Echo Lake, Mission Lake, Katepwa Lake, Crooked Lake, Ceratophyllum demersum, Myriophyllum exalbescens, Potamogeton pectinatus, Potamogeton richardsonii, Potamogeton vaginatus, Kjeldahl nitrogen, Organic carbon, Chlorophyll a.

An extensive survey of the percentage abundance of water plants in different lakes of the Qu'Appelle basin system in Saskatchewan has revealed a possible link between the dominant species and the total phosphate level in the water. Eleven sites in the Qu'Appelle lakes were sampled for macrophytes just as the weed inflorescences were appearing above the surface of the water. Chemical studies were made of the water and sediments according to standard methods. Five species of plants were considered to be dominant or codominant in the lakes studied: Ceratophyllum demersum, Myriophyllum exalbescens, Potamogeton pectinatus, Potamogeton richardsonii, and P. vaginatus; the predominant plants were, however, P. pectinatus and P. richardsonii. Ceratophyllum sp. was located only where there was less than 0.5 ppm total phosphate; Potamogeton richardsonii was frequently dominant in these regimes. At higher phosphate concentrations, Potamogeton pectinatus was found to be dominant and Ceratophyllum sp. absent. This study supports the findings of Fitzgerald (1970) that the aquatic plants are dependent on phosphates from the water and that phosphates 'tide up' in sediments are not so readily available, even though present in very high concentrations. (Holoman-Battelle)

ABUNDANCE, DISTRIBUTION AND OIL BIODEGRADATION POTENTIAL OF MICROORGANISMS IN RARITAN BAY,
Rutgers-The State Univ., New Brunswick, N.J. Dept. of Biochemistry and Microbiology.
R. M. Atlas, and R. Bartha.
Environmental Pollution, Vol 4, No 4, p 291-300, June 1973. 3 fig, 5 tab, 19 ref.

Descriptors: *Microbial degradation, *Marine microorganisms, *Ecological distribution, *Bioindicators, Monitoring, Gas chromatography, Sea water, Water temperature, Oil pollution, Biodegradation, Water sampling, Cultures, Salinity, Variability.
Identifiers: *Raritan Bay, *Substrate utilization, *Crude oil, Enumeration, Fate of pollutants, Sweden crude oil, South Louisiana crude oil, Trace levels, Mineralization, Biomonitoring, Most probable number test, Carbon dioxide evolution, Seasonal variation.

Using an improved enumeration technique, the abundance of oil degrading microorganisms was monitored in Raritan Bay during a one-year period. The determined numbers varied from a low of 20/1 to a high of 3400/1 of surface sea water. The abundance of oil-degrading microorganisms was positively correlated with existing patterns of low-level oil pollution and with the water temperature, but was independent of total microbial counts. All tested sea water samples contained an adequate microbial population to cause the extensive biodegradation of added Sweden crude oil within eighteen days. The number of oil-degrading microorganisms in sea water samples was found to be a useful and sensitive indicator of low-level oil pollution that escaped routine gas chromatographic detection. (Holoman-Battelle)

TUBIFICIDS AND WATER QUALITY: A REVIEW,
Central Electricity Generating Board, Ratcliffe-on-Soar (England). Freshwater Biology Unit.
R. J. Aston.
Environmental Pollution, Vol 5, No 1, p 1-10, July 1973. 3 fig, 51 ref.

Descriptors: *Tubificids, *Water quality, *Water pollution, *Bioindicators, *Reviews, *Organic wastes, Water pollution effects, Oligochaetes, Annelids, Dissolved oxygen, Oxygen sag, Invertebrates, Heavy metals, Animal physiology, Insecticides, Thermal pollution, Natural streams, Wood preservatives (Pesticides), Fungicides, Embryonic

growth stage, Mature growth stage, Resistance, Dominant organisms, Anaerobic conditions, Respiration, Aquatic animals, Copper, Reproduction, Chlorinated hydrocarbon pesticides, Sewage effluents, Lake Michigan, Tripical regions, Ions, DDT, Laboratory tests, Condensers, Effluents, Heated water, Environmental effects, Benthic fauna, Thermal stress, Animal growth.
Identifiers: Population density, Enrichment, BHC, Macroinvertebrates, Derwent River, Ryacodrilus coccineus, Aulodrilus pleuriseta, Sensitivity, Potamothrix hammoniensis, Tubifex tubifex, Psammoryctes barbatus, Limnodrilus claparedianus, Limnodrilus udekemianus, Limnodrilus hoffmeisteri, Tubifex kessleri, Aulodrilus americanus, Peloscolex ferox, Potamothrix moldaviensis, Branchiura sowerbyi, Green Bay, Respiratory rates, Oxygen consumption, Pentachlorophenate, Trent River, Ivankovskoe Reservoir, Embryonic development, Red Cedar River.

In conditions of low dissolved oxygen concentrations prevalent in water bodies receiving heavy sewage pollution, Limnodrilus hoffmeisteri and Tubifex tubifex predominate and other species are eliminated in a rough sequence, dependent on the level of pollution. The respiratory physiology of some species is adapted to operate at very low oxygen concentrations and they are able to survive for long periods in anaerobic conditions. The reproductive rate of L. hoffmeisteri is also unaltered by a decrease in dissolved oxygen to very low concentrations. Heavy ions, such as copper, are likely to eliminate tubificids, but the insecticide BHC may cause an increase in tubificids while other aquatic invertebrates are eliminated. Warm condenser effluents are likely to increase the abundance of L. hoffmeisteri and, in some cases, provide suitable conditions for colonization by the exotic tubificid, Branchiura sowerbyi. An evaluation is made of the possible use of tubificids as indicators of water quality. (Holoman-Battelle)

USE OF THE HETEROTROPHIC ACTIVITY TECHNIQUE AS A MEASURE OF EUTROPHICATION,
Simon Fraser Univ., Burnaby (British Columbia). Dept. of Biological Sciences.
J. W. Wentworth.
Environmental Pollution, Vol 5, No 1, p 59-72, July 1973. 7 fig, 2 tab, 7 ref.

Descriptors: Aquatic environment, *Eutrophication, *Bioindicators, Rivers, *Canada, *Measurement, *Water pollution, *Water quality, Radioactivity techniques, Laboratory tests, Biochemical oxygen demand, Trophic level, Natural streams, Nutrients, Coliforms, Aquatic bacteria, Absorption, Organic matter.
Identifiers: *Heterotrophy, Heterotrophic bacteria, Substrate utilization, Mineralization, Data interpretation, Fate of pollutants, Glucose, Soluble organic carbon, Particulate organic carbon, Capilano River, Chilliwack River, Fraser River, Serpentine River, Nicomekl River, Michaelis-Menten equation, Enumeration, Particulate nitrogen.

An examination has been made of the relationship between the heterotrophic activity of the indigenous microflora of several waters and the various parameters used to measure eutrophication. Two-liter water samples collected in sterile flasks from the Capilano, Chilliwack, Fraser, Serpentine and Nicomekl Rivers in British Columbia were analyzed for heterotrophic activity, the numbers of heterotrophic bacteria, the concentrations of particulate carbon and nitrogen, soluble carbon, BOD, and total coliform. Heterotrophic activity determination was based upon the uptake and mineralization of C-14-labelled glucose by the heterotrophic microflora of the aquatic environments. The data were analyzed by Michaelis-Menten enzyme kinetics equations. The heterotrophic microbes of the waters studied displayed linear utilization of added radioactive glucose as a function of time. Glucose uptake and mineralization rates conformed to the kinetic models. This heterotrophic activity correlated well with the viable heterotrophic bacterial count, soluble and particulate carbon, and nitrogen concentrations but not BOD values. The data suggest that the waters tested may be ranked in order of nutrient enrichment by use of the heterotrophic activities they display. The employment of this technique to analyze river waters for nutrient content when several chemical analyses show little significant differences is discussed. (Holoman-Battelle)

SYNERGISM OF INSECTICIDES BY HERBICIDES,
Wisconsin Univ., Madison. Dept. of Entomology.
E. P. Lichtenstein, T. T. Liang, and B. N. Anderegg.
Science, Vol 181, No 4102, p 847-849, August 1973. 1 fig, 2 tab, 10 ref.

Descriptors: *Bioassay, *Pesticide toxicity, *Insecticides, *Herbicides, DDT, Mosquitoes, 2 4-D, Dieldrin, Chlorinated hydrocarbon pesticides, Phosphothioate pesticides, Triazine pesticides, Urea pesticides, Monuron, Diazinon.
Identifiers: *Synergism, Atrazine, Simazine, Carbofuran, Parathion, Paraoxon, Diazoxon, Dyfonate, Dyfoxon, Phorate, Phorate sulfoxide, Phorate sulfone, House flies, Fruit flies, Drosophila melanogaster, Musca domestica, Aedes aegypti, Flies, p p'DDT.

The herbicides atrazine, simazine, monuron, and 2,4-D enhanced the toxicity of selected insecticides to Drosophila melanogaster Meigen, Musca domestica L., and larvae of Aedes aegypti L. The insecticides - nine organophosphorus compounds, two chlorinated hydrocarbons, and one carbamate - were used at dosages that resulted in low insect mortalities, while the herbicides by themselves were nontoxic. Atrazine was most effective. With increasing amounts of this herbicide and constant amounts of some insecticides, increasing mortalities of fruit flies were observed. Exposure of the insects for 24 hours to carbofuran (0.5 microgram), p,p'-DDT (4 micrograms), parathion (0.35 microgram), and diazinon (0.2 microgram) alone resulted in mortalities of 7.5, 9.5, 8, and 10.5 percent, respectively. Based on dosage mortality curves obtained with increasing amounts of atrazine, mortalities of 50 percent of the insect populations would have been achieved with 23, 40, 6, and 10 micrograms of atrazine added to the above-mentioned dosages of carbofuran, DDT, parathion, and diazinon, respectively. SENSITIVITY OF DUNALIELLA AND SCENEDESMUS (CHLOROPHYCEAE) TO CHLORINATED HYDROCARBONS,
California State Univ., San Diego. Dept. of Biology.
E. J. Luard.
Phycologia, Vol 12, Nos 1/2, p 29-33, June 1973. 2 tab, 14 ref.

Descriptors: *Chlorophyta, *Phytoplankton, Resistance, Laboratory tests, DDT, DDE, DDD, Polychlorinated biphenyls, Inhibition, Absorption, Aquatic algae, Marine algae, Insecticides, Chlorinated hydrocarbon pesticides, Cytological studies, Radioactivity techniques, Bioassay, Chrysophyta, Pyrrophyta, Dinoflagellates, Cyanophyta, Barley, Euglenophyta, Rhodophyta, Diatoms.
Identifiers: *Scenedesmus quadricauda, *Dunaliella tertiolecta, *Sensitivity, *Chlorinated hydrocarbons, C-14, Aroclor 1254, Spinach, Coccolithophores, Skeletonema costatum, Coccolithus huxleyi, Cyclotella nana, Monochrysis lutheri, Cylindrotheca closterium, Thalassiosira spp, Phaeodactylum tricornutum, Peridinium trochoideum, Dunaliella euchlora, Amphidinium carteri, Pyramimonas spp, Codium fragile, Chaetomorpha area, Chlorella spp, Protococcus spp, Oedogonium, Chlamydomonas reinhardtii, Microcystis aeruginosa, Anabaena cylindrica, Euglena gracilis, Porphyridium.

Dunaliella tertiolecta and Scenedesmus quadricauda, two algal species with quite different morphological characters, were tested for resistance to chlorinated hydrocarbons, as measured by carbon-14 uptake. The purpose of such tests was to determine the significance of cell barriers in confering resistance to chlorinated hydrocarbons. Young, rapidly dividing cells were exposed to 0.1-1000 ppb concentrations of the hydrocarbons in flasks to which were added sodium C-14-bicarbonate and unlabeled sodium bicarbonate. C-14 fixation by the cells was determined by liquid scintillation using a xylene based scintillation fluor. Both species were found to be resistant to 2,2,-bis (p-chlorophenyl)-1,1,1-trichloroethane (DDT) and its analogs (1000 ppb), but sensitive to polychlorinated biphenyl (PCB); Scenedesmus at 0.1 ppb, and Dunaliella at 100 ppb. A literature summary is included concerning inhibition of plants by chlorinated hydrocarbons. (Holoman-Battelle)

GROWTH OF DICTYOSPHAERIUM, SELENASTRUM, AND SCENEDESMUS (CHLOROPHYCEAE) IN A DILUTE ALGAL MEDIUM,
Connecticut Univ., Storrs. Biological Sciences Group.
F. R. Trainor, and L. E. Shubert.
Phycologia, Vol 12, Nos 1/2, p 35-39, June 1973. 4 tab, 14 ref.

Descriptors: *Growth rates, *Cultures, Bioassay, Light, *Chlorophyta, Rivers, Nutrients, *Scenedesmus.
Identifiers: *Dictyosphaerium, *Selenastrum, Culture media, Dilute media, Bristol's medium.

The growth of Scenedesmus, Dictyosphaerium, and Selenastrum was examined in a dilute medium with a total of 28.5 mg/l inorganic salts and in river water. Algae were grown in stationary culture in 50 ml flasks or on a roller tube rotator at 14 rpm in test tubes at 22C. Growth was measured by direct cell counts and with a colorimeter. Routinely, an actively growing inoculum was used, sufficient to give an initial cell concentration of approximately 200,000 cells/ml; this was adequate for colorimeter readings. Diurnal light of 3200 lux intensity was used throughout. Each day, after a determination of growth, the culture was transferred, by dilution to the original cell number. Some cultures were grown in this way for several weeks, and a uniform daily increment in growth is reported for 10-day experiments. Using this technique similar growth rates were recorded in sterile-filtered river water used as a medium. Stock cultures can be held in dilute media for several weeks, by first establishing a healthy population, and then maintaining the culture under minimal conditions, usually light at 160-215 lux. Scenedesmus and Dictyosphaerium were cultured in the dilute medium and showed doublings of 1 plus/day. Growth of Selenastrum was compared in one experiment. Results with the dilute medium compared favorably with those for Bristol's medium. (Little-Battelle)

COLUMBIA RIVER THERMAL EFFECTS STUDY: REACTOR EFFLUENT PROBLEMS,
Battelle Memorial Insti., Richland, Wash. Pacific Northwest Labs.
C. D. Becker.
Journal Water Pollution Control Federation, Vol 45, No 5, p 850-869, May 1973. 15 fig, 45 ref.

Descriptors: *Thermal stress, *Columbia River, *Environmental effects, *Salmonids, *Thermal powerplants, *Water pollution, *Reviews, Heated water, Fish diseases, Fish behavior, Invertebrates, Fish populations, Heat resistance, On-site investigations, Laboratory tests, Thermal pollution, Spawning, Predation, Water temperature, Food habits, *Thermal pollution.
Identifiers: Survival, Data interpretation, Sonic tracking, Steelhead trout, Pacific salmon, Salmo gairdneri, Oncorhynchus spp, Oncorhynchus tshawytscha, Oncorhynchus kisutch, Median tolerance limit, Oncorhynchus nerka, Gas bubble disease, Columnaris disease, Limpets, Chondrococcus columnaris, Catostomus macrocheilus, Fisherola nuttalli.

Thermal studies of the environmental impact of heated discharges from thermo-electric power plants, nuclear and fossil-fueled, are passing through a decisive phase. The Columbia River (Wash.) thermal effects study utilized the expertise, programs, and facilities of three agencies in order to focus on thermal problems peculiar to the Columbia River during 1968-70. The studies dealt with (a) spawning populations of adult and migration timing of juvenile chinook salmon, (b) sonic tracking of adult salmonids past heated reactor discharges, (c) thermal resistance of adult salmonids, (d) passage of juvenile salmonids through reactor discharge plumes, (e) equilibrium loss and ecological death of juvenile salmonids from thermal shock, (f) thermal shock and predation on juvenile salmonids, (g) food and feeding of juvenile chinook salmon, (h) rearing temperatures and artificial propagation, (i) gas-bubble disease of salmonids, (j) columnaris disease in Columbia River fish, and (k) effects on Columbia River invertebrates. EFFECT OF SKF-525A ON BRAIN ACETYLCHOLINESTERASE INHIBITION BY PARATHION IN FISHES,
Mississippi State Univ., State College. Dept. of Zoology.
J. R. Gibson, and J. L. Ludke.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 3, p 140-142, March 1973. 1 tab, 6 ref.

Descriptors: *Bioassay, *Sunfishes, *Shiners, *Pesticide toxicity, Phosphothioate pesticides, Inhibition, Animal physiology.
Identifiers: *Parathion, *SKF-525A, Antagonists, Acetylcholinesterase, Lepomis cyanellus, Lepomis macrochirus, Notemigonus crysoleucas.

Golder shiners (Notemigonus crysoleucas), green sunfish (Lepomis cyanellus), and bluegill sunfish (L. macrochirus) with no prior exposure to pesticides were used to study the effect of SKF-525A on Parathion toxicity as determined by brain ACHE activity. After acclimation, the fish were exposed to 1 ppm SKF-525A for 24 hours then to 200 ppm parathion for 10 hours. At the end of the exposure, test and control fish were sacrificed and ACHE activity determined. From the results, it is concluded that SKF-525A pretreatment affords significant protection against parathion inhibition of brain ACHE in the golden shiner and green sunfish, but not in bluegill sunfish. (Little-Battelle)

SOME PHYSIOLOGICAL ASPECTS OF SUBLETHAL HEAT STRESS IN THE JUVENILE STEELHEAD TROUT (SALMO GAIRDNERI) AND COHO SALMON (ONCORHYNCHUS KISUTCH),
Bureau of Sport Fisheries and Wildlife, Seattle, Wash. Western Fish Disease Lab.
G. Wedemeyer.
Journal of the Fisheries Research Board of Canada, Vol 30, No 6, p 831-834, June 1973. 5 fig, 10 ref.

Descriptors: *Thermal stress, *Fish physiology, *Coho salmon, *Juvenile fish, *Laboratory tests, Water temperature, Acid-base equilibrium, Cold-water fish, Vitamins, Hydrogen ion concentration, Bioassay, Chemical properties, Biological properties, Water pollution effects, *Thermal pollution.
Identifiers: *Steelhead trout, Biochemical tests, Biochemical characteristics, Blood, Salmo gairdneri, Oncorhynchus kisutch, Plasma, Acclimatization.

The physiological stress and recovery times required were compared when hatchery-reared juvenile coho salmon and steelhead trout acclimated to 10C were subjected to a rapid, sublethal increase (3 min) to 20C and then held at that temperature. Groups of 70 fish were used and subsamples of 10 fish were taken at 0, and 1, 3, 5, 24, 48, and 72 hr. Biochemical analyses of blood samples for interrenal vitamin C levels, plasma bicarbonate, pH, Ca, chloride, cholesterol, glucose, hemoglobin, total protein, and oxygen consumption were carried out. The rapid temperature increase was found to impose a greater stress on juvenile coho salmon than on juvenile steelhead trout. Both species suffered hyperglycemia, hypocholesterolemia, increased blood hemoglobin, and decreased blood sugar regulatory precision, but the steelhead recovered more quickly. Acid-base equilibrium was essentially unaffected, and only the coho suffered any significant interrenal vitamin C depletion. Vitamin C normalization required about 24 hr. (Holoman-Battelle)

EFFECTS OF BRIEF TEMPERATURE INCREASES ON LARVAE OF THE AMERICAN OYSTER (CRASSOSTREA VIRGINICA),
Virginia Inst. of Marine Science, Gloucester Point.
R. J. Diaz.
Jouranl of the Fisheries Research Board of Canada, Vol 30, No 7, p 991-993, July 1973. 1 fig, 1 tab, 3 ref.

Descriptors: *Temperature, *Growth rates, *Larvae, Environmental effects, Larval growth stage, Mollusks, Invertebrates, Mortality, Animal growth, *Thermal stress, *Oysters, *American oyster, Macroinvertebrates, Crassostrea virginica, Data interpretation.

Temperature increases effected with a heat exchanger consisting of an entrainment tube in a constant temperature bath were studied in relation to their effects on American oyster larvae. To estimate growth and mortality, two 1-ml subsamples of larvae were taken 48 hr after the temperature increase and then at 4-day intervals. The length of 40 live larvae were measured and all living larvae counted. The data were then analyzed statistically. Growth of larvae was not affected by brief temperature increases of 10 to 15 degrees C, but a 20 degree increase had a detrimental effect. Mortality increased significantly following all temperature increases. Setting rates of larvae receiving 15 to 21 degree increases were significantly lower. Growth rate, mortality, and setting also seemed to be affected by the age at which larvae received a thermal shock. (Holoman-Battelle)

Identifiers: *Subalpine streams, *Substrates, Deer Lick Creek, Bear Creek, Batrachospermum vagum, Batrachospermum testale, Monostroma quaternarium, Hydrurus foetidus, Ulothrix, Orthophosphates, Ammonium, Pyroxene-gabbro conglomerates, Argillaceous quartzites, Silicious argillite.

Comparative studies of the microhabitats of the algae Hydrurus foetidus, Monostroma quaternarium and two species of Batrachospermum have disclosed differences which apparently control the specific distribution of these algae within the same subalpine stream beds. Hydrurus attached primarily to sandstones in bright, direct sunlight and exhibited cytological deterioration, decreases in chlorophyll and rates of photosynthesis following 6 days' transfer to the dimmer nearby habitats of Batrachospermum vagum and B. testale. Batrachospermum, which attached to many rock types, grew only in shaded areas and exhibited rapid deterioration such as bleaching, reduction in chlorophyll and photosynthetic rates when moved to the brighter habitats of Hydrurus or Monostroma. Monostroma tolerated a wide range in light intensities, but showed exceptional specificity for iron-rich conglomerates. Monostroma thrived exclusively just below the water surface on the downstream sides of conglomerates with their holdfasts intimately associated with the black iron-rich mineral (s). These findings are documented by laboratory and field measurements and experiments. (Holoman-Battelle)

GROWTH AND CELL-SIZE DISTRIBUTION OF MARINE PLANKTONIC ALGAE IN BATCH AND DIALYSIS CULTURES,
Bedford Inst., Dartmouth (Nova Scotia).
A. Prakash, L. Skoglund, B. Rystad, and A. Jensen.
Journal of the Fisheries Research Board of Canada, Vol 30, No 2, p 143-155, February 1973. 8 fig, 3 tab, 23 ref.

Descriptors: *Cultures, *Marine algae, *Growth rates, *Size, Diatoms, Dinoflagellates, Phytoplankton, Chlorophyll, Distribution patterns, Bioassay, Dialysis, Pyrrophyta.
Identifiers: *Continuous cultures, Cyclotella nana, Skeletonema costatum, Thalassiosira, Phaeodactylum tricornutum, Gonyaulax tamarensis.

Unialgal cultures of Skeletonema costatum, Cyclotella nana, Thalassiosira sp., Phaeodactylum tricornutum, and Gonyaulax tamarensis were grown by batch and dialysis methods to examine differences in growth characteristics and cell-size distribution. Erlenmeyer flasks were used for the batch studies. Three variations were used in the dislysis cultures: continuous reservoir-filter dialysis; batch reservoir-filter dialysis; continuous reservoir-bag dialysis. Growth of algae was measured by monitoring changes in cell numbers and volumes with a Coulter Counter. An extended exponential growth phase and a higher maximum population characterized growth of planktonic algae in a dialysis system compared with that in a batch system. Algal cells grown in a dialysis culture had higher chlorophyll content and a larger average cell size than those grown in a batch culture. In both types of culture, changes in cell-size distribution were related to the phases of the growth cycle with maximum cell-size during the stationary phase. Various interactions of the component reactions of photosynthesis leading to changes in growth pattern and cell-size distribution are discussed. (Little-Battelle)
W73-15128

THE STRUCTURE AND DEVELOPMENT OF A FORM OF DINOCOCCUS OEDOGONII (GEITLER) FOTT,
E. G. Williams, and J. W. G. Lund.
Nova Hedwigia, Vol 23, Nos 2-3, p 493-513, 1972. 48 fig, 14 ref.

Descriptors: *Aquatic algae, *Plant morphology, *Plant growth, *Pyrrophyta, Systematics, Dinoflagellates.
Identifiers: *Dinococcus oedogonii.

Aform of Dinococcus oedogonii (Geitler) Fott is described. It shows considerable variability in cell shape, presence, absence and orientation of the apiculate poles and presence, position, or absence of an attaching disc. Reproduction is by gymnodinioid zoospores usually two per cell but sometimes one, or by autospores-two per cell. Colonies of 8 cells may be formed by repeated reproduction by autospores; they disintegrate as their cells reproduce by zoospores. Clones were followed and the variability of their cells and the methods of reproduction shown to be phenotypic and not genotypic. The unsatisfactory nature of the present systems of classification for the Dinococcales and the difficulties of identifying species, or even genera, are illustrated by reference to the alga described. (Holoman-Battelle)

Descriptors: *Cyanophyta, *Aquatic algae, *Soil algae, *Speciation, *Systematics, *Ecological distribution, Environmental effects, Salt tolerance, Soil environment, Aquatic environment, Temperature, Plant growth, Salt marshes, Habitats.
Identifiers: *India (Rajasthan), Chroococcus, spp, Microcystis aeruginosa, Myxosarcina burmensis, Arthrospira platensis, Lyngbya spp, Oscillatoria spp, Phormidium faveolarum, Schizothrix vaginata, Spirulina laxissima, Hydrocoryne spongiosa, Tolypothrix spp, Dichothrix baueriana, Rivularia beccariana, Rivularia globiceps var. abuensis, Synechococcus elongatus, Aphanocapsa spp, Chroococcus turgidus, Microcoleus palludosus, Porphyrosiphon notarisii, Oscillatoria jasorvensis, Oscillatoria spp, Anabaena spherica, Phormidium molle, Anabaena spp, Oryzae, Aulosira spp, Gloeotrichia kurziana, Hapalosiphon luteolus, Sambher Lake.

Twenty-seven species of blue-green algae are reported from different localities and habitats of Rajasthan. A new variety of Rivularia globiceps has been described from Mt. Abu. The chief environmental factors and habitat conditions affecting growth of the algae have been outlined. The use of Anabaenopsis arnoldii as a fertilizer has been outlined. (Holoman-Battelle)

MICROFUNGI COLONIZING SUBMERGED STANDING CULMS OF PHRAGMITES COMMUNIS TRIN,
Nottingham Univ. (England). Dept. of Botany.
A. E. Apinis, C. G. C. Chesters, and H. K. Taligoola.
Nova Hedwigia, Vol 23, Nos 2-3, p 473-480, 1972. 5 tab, 9 ref.

Descriptors: *Aquatic fungi, *Isolation, *Systematics, Speciation, Aquatic plants, Grasses.
Identifiers: *Phragmites communis, *Reed grass, *Colonization, Culms, Ascomycetes, Hyphomycetes, Pyrenomycetes, Macrophytes, Micronectriella, Cerisporopsis, Helminthosporium dematioideum, Dictyuchus monosporus, Lasiosphaeria, Dictyosporium, Septoria arundinacea, Ophiobolus, Leptosphaeria culmifraga, Tritirachium, Wettsteinina niesslii, Stagonospora elegans, Passeriniella discors, Leptosphaeria arundinacea.

The mycoflora of submerged parts of standing culms of Phragmites communis consists mainly of Ascomycetes and Sphaeropsidales and is distinctly different from that of the aerial parts in which Hyphomycetes predominate. Sporulation of fungi on submerged parts does not begin until culms are moribund or dead, usually in the early spring after flowering. The commonest species of fungi colonizing submerged parts of culms near the water surface are different from those colonizing the mud covered parts deep below. Septoria arundinacea, Leptosphaeria arundinacea and Ophiobolus sp are common on the former while Wettsteinina niesslii and Dictyuchus monosporus are common on the latter parts. It is the fungi on the upper sections of the submerged parts of the host which possibly contribute to the weakening and eventual collapse of P. communis culms. (Holoman-Battelle)
W73-15131

MICROFUNGI COLONIZING COLLAPSED AERIAL PARTS OF PHRAGMITES COMMUNIS TRIN. IN WATER,
Nottingham Univ. (England). Dept. of Botany.
T. K. Taligoola, A. E. Apinis, and C. G. C. Chesters.
Nova Hedwigia, Vol 23, Nos 2-3, p 465-472, 1972. 6 tab, 5 ref.

Descriptors: *Aquatic fungi, *Isolation, *Seystematics, Aquatic plants, Decomposing organic matter, Leaves, Speciation, Grasses.
Identifiers: *Colonization, *Phragmites communis, *Reed grass, Stems, Debris, Hyphomycetes, Ascomycetes, Culms, Leaf litter, Pyrenomycetes, Macrophytes, Lasiosphaeria, Wettsteinina niesslii, Micronectriella, Leptosphaeria spp., Diplodina, Septoria arundinacea, Alternaria tenuis, Dictyosporium, Dactylella, Tritirachium, Dictyuchus monosporus, Hendersonia crastophila, Stagonospora elegans, Papularia arundinis, Phoma, Hunicola fuscoatra var. fuscoatra, Acrotheca, Helotium citrinulum, Helminthosporium dematioideum, Cladosporium herbarum, Dactylaria, Ceriosporopsis spp, Thielavia, Dasyscyphus spp, Passeriniella discors, Diplodina arundinacea, Didymella, Hendersonia spp.

The aerial parts of Phragmites communis Trin. after collapsing and being submerged, eventually lose their original aerial mycoflora dominated by Hyphomycetes and a few Ascomycetes and are subsequently colonized by aquatic fungi which include certain Ascomycetes, Sphaeropsidales, aquatic Hyphomycetes and other fungi. This colonization takes place in two main stages. During the first stage the aerial fungi, such as Alternaria tenuis, still persist on the floating stems, and the leaf litter mycoflora is characterized by Diplodina sp. During the second stage aquatic Ascomycetes, such as Leptosphaeria culmifraga and Hyphomycetes, such as Articulospora sp., appear at an increasing frequency on the litter at the bottom of the pond. (Holoman-Battelle)

AQUATIC FUNGI FROM AN ANTARCTIC ISLAND AND A TROPICAL LAKE,
Freshwater Biological Association, Ambleside (England).
L. G. Willoughby.
Nova Hedwigia, Vol 22, Nos 1-2, p 469-488, 1971. 112 fig, 31 ref.

Descriptors: *Aquatic fungi, Antarctic, *Soil fungi, *Systematics, Plant morphology, Cultures, Aquatic environment, Isolation, Speciation, Lakes, Freshwater, Water sampling, Plant growth, Water temperature, Soil temperature, Cold regions, Tropical regions.
Identifiers: *Uganda (Lake George), *Antarctia (Signy Island), Phycomycetes, Oomycetes, Rhizophydium signyense, Aphanomyces, Hypochytrium catenoides, Lagenidium giganteum, Pythium, Catenaria angullulae, Rhizophlyctis rosea, Rhizophlyctis ingoldii, Nowakowskiella hemisphaerospora, Nowakowskiella elegans, Catenophlyctis variabilis, Allomyces anomalus, Achyla recurva, Chytridium proliferum, Chytriomyces willoughbi, Phlyctochytrium acuminatum, Rhizophydium pollinis-pini.

In a study of aquatic fungi from Signy Island, Antarctia and Lake George, Uganda, freshwater lake sampling yielded Aphanoyces sp., Hyphocytrium catenoides and Lagenidium giganteum from the former and Catenaria anguillulae and Chytridium proliferum from the latter. C. anguillulae appears to be a particularly dominant and nutritionally versatile fungus in Lake George. Soil samples from Signy Island gave a previously undescribed species, Rhizophydium signyense, saprophytic on chitinous materials. (Holoman-Battelle)

BERYLLUM UPTAKE BY THE COMMON GUPPY USING RADIOISOTOPE BE-7. I. PRELIMINARY STUDY: TRACER MECHANICS AND PROCEDURES,
Aerospece Medical Research Lab., Wright-Patterson AFB, Ohio.
F. C. Damm, and A. R. Slonim.
Available from the National Technical Information Service as AD-758 814. Final Report No. AMRL-TR-72-94, October 1972. 17 p, 4 fig, 2 tab, 6 ref. Project No. 6302.

Descriptors: *Tracers, *Absorption, *Methodology, *Beryllium, *Radioactivity techniques, Alkaline earth metals, Toxicity, Aqueous solutions, Freshwater fish, Pollutant identification.
Identifiers: *Guppy, Beryllium radioisotopes, Be-7, Scintillation counting, Half-life, Lebistes reticulatus, Path of pollutants.

The mechanics and several variables concerning the use of radioactive beryllium, Be-7, and the possible interaction between beryllium solutions and glass were studied prior to the application of the isotope (in follow-on phase) as a monitor of beryllium toxicity in guppies. Radioactivity was measured in a scintillation counter incorporating a sodium iodide well detector. Tracer activity or efficiency was evaluated under various conditions (e.g., isotope concentration, storage in glass over time, and counting geometry relative to sample size and position in detector). Tracer activity was proportional to tracer concentration and unaltered in a glass container for a period up to 8 days. Under the conditions of this study, beryllium was not lost from BeSO4 solutions in glass bioassay jars due to adsorption onto the glass or evaporation. Counting efficiency was relatively independent of sample size or position within well detector, so that water samples and exposed fish can be treated alike relative to the detector geometry. A procedure was outlined for estimating beryllium uptake in fish exposed to aqueous beryllium solutions to which tracer has been added. (See also W73-15136) (Holoman-Battelle)
W73-15135

BERYLLIUM UPTAKE BY THE COMMON GUPPY USING RADIOISOTOPE BE-7. II. BERYLLIUM CONCENTRATION IN FISH,
Aerospace Medical Research Lab., Wright-Patterson AFB, Ohio.
A. R. Slonim, and F. C. Damm.
Available from the National Technical Information Service as AD-758 815. Final Report No. AMRL-TR-72-95, October 1972. 25 p, 12 tab, 5 ref, 2 append. Project No. 6302.

Descriptors: *Beryllium, *Toxicity, *Bioassay, *Radioactivity techniques, Absorption, Chemical analysis, Environmental effects, Kinetics, Freshwater fish, Monitoring, Fry, Path of Pollutants, Pollutant identification, Laboratory tests, Hardness (Water), Alkaline earth metals.
Identifiers: Bioaccumulation, *Guppy, *Lebistes retriculatus, Be-7, Animal tissues, Biological magnification, Beryllium radioisotopes, Median tolerance limit, Fate of pollutants, Kidneys, Intestine, Ovaries, Gills, Liver, Brain, Heart, Eyes, Spleen.

Two bioassays were conducted in which radioactive beryllium, Be-7, was added as a tracer to beryllium sulfate solutions in order to obtain some insight into beryllium toxicity in fish. Tracer mechanics and procedures for measuring beryllium uptake in guppies were determined in the previous phase. The bioassay data indicated that the amount of beryllium concentrated within the guppies (and fry) was influenced by the beryllium concentration in solution and by fish size (inversely), and to a less extent by exposure period, but not by fish age, buffering to the beryllium solution, or water hardness. Generally, beryllium uptake varied greatly among guppies exposed to the same enviromental conditions. Examination of individual tissues and organs of six of the guppies revealed that most of the beryllium was concentrated in the viscera; beryllium uptake was highest (per total organ) in the gastrointestine and kidney of the 9 organs analyzed provisionally. These studies suggest that the lethality of beryllium in fish is not dependent upon the amount concentrated within the fish, but more likely on the effect of beryllium on a particular target organ, cellular or subcellular component. More work is required to determine the mechanism of beryllium toxicity in fish. (See also W73-15135) (Holoman-Battelle)

A PRELIMINARY REPORT ON THE USE OF SEQUENTIAL COMPARISON INDEX TO EVALUATE ACID MINE DRAINAGE ON THE MACROBENTHOS IN A PRE-IMPOUNDMENT BASIN,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
G. M. Simmons, Jr.
Trans Am Fish Soc. Vol 101, No 4, p 701-713, 1972. Illus.
Identifiers: *Acid mine drainage, *Benthos, Colonization, Evaluation, Impoundments, Index, Molluscan, Mussels, *Virginia (North Anna River).

A 35 mile segment of the North Anna River, Virginia, is currently being impounded to provide cooling water for a nuclear reactor. The headwaters of a major tributary of the North Anna River, Contrary Creek, was the site of extensive pyrite mining operations at the turn of the century. Contrary Creek is a source of acid mine drainage, and confluences with the North Anna River approximately midway through the pre-impoundment basin. The sequential comparison method of establishing diversity indices of community structure was used to evaluate the effect of acid mine drainage on the macrobenthos in a 21.5 mile segment of the river. The diversity indices indicated that the North Anna River recovers from acid mine drainage approximately 19 miles below the entrance of Contrary Creek or 2 miles below the present dam site. However, the molluscan element, which occupied 32% of the macrobenthos at the upstream control station, did not show a reoccurrence within the study area below the discharge of Contrary Creek. The lack of mussel recolonization indicates that the river has only partially recovered from the acid drainage. Even though the Sequential Comparison Technique provides a rapid method of gathering numerical information regarding biological water quality, the technique as currently used does not exhibit sufficient resolution to distinguish between different degrees of biological recovery.--Copyright 1973, Biological Abstracts, Inc.

SEASONAL FLUCTUATIONS OF AQUATIC MACROINVERTEBRATES IN OAKWOOD BOTTOMS GREENTREE RESERVOIR,
Tennessee Valley Authority, Norris.
W. A. Hubert, and J. N. Krull.
The American Midland Naturalist, Vol 90, No 1, p 177-185, July 1973. 4 tab, 15 ref.

Descriptors: Aquatic animals, *Tennessee, Crustaceans, Aquatic insects, Mollusks, Bottom sampling, Systematics, Annelids, Water chemistry, Biomass, Animal populations, Water level fluctuations, Fluctuations, Oligochaetes, Isopods, Invertebrates, Amphipoda, Crayfish, Dragonflies, Mites, Mayflies, Caddisflies, Water beetles, Diptera, Midges, Mosquitoes, Gastropods, Snails, Clams, Speciation, Ditches, Water temperature, Turbidity, Alkalinity, Dissolved oxygen, Hydrogen ion concentration, Conductivity, On-site investigations.
Identifiers: *Seasonal variation, *Macroinvertebrates, *Species diversity, *Species density, *Oakwood Bottoms Greentree Reservoir (Tenn), Flatworms, Water mites, Fairy shrimp, Turbellaria, Platyhelminthes, Leeches, Hirudinea, Anostraca, Eubranchipus serratus, Decapods, Scuds, Water boatmen, Water bugs, Spiders, Backswimmers, Flies, Snails, Fishflies, Beetles, Marsh flies, Horseflies, Sample preservation, Asellus forbesi, Lirceus fontinalis, Crangonyx forbesi.

The seasonal abundance and diversity of aquatic macroinvertebrates has been described within Oakwood Bottoms Greentree Reservoir. An 8-in diameter wire household sieve was used to collect the organisms during five surveys, each of which was made during different seasons of 1971. The samples were preserved in 70 percent ethyl alcohol for identification, counting and weighing. Biomass was calculated on a wet weight basis and included nonliving portions of invertebrates. The following physical and chemical parameters were measured at the study area: water temperature, turbidity, water level fluctuation, DO, pH, total alkalinity and conductivity. A large variety of macroinvertebrates occurred at Oakwood, with populations in permanent water areas (56 taxa) distinctly different from populations in areas with temporary water conditions (20 taxa). The greatest number and biomass of invertebrates occurred from November to April with fingernail clams, amphipods, isopods and pulmonate snails predominating. Sufficient quantities of macroinvertebrates are present to serve as a significant food source for waterfowl utilizing the Reservoir during spring and autumn migrations. (Holoman-Battelle)

A ZONAL LEAF SPOT OF WATERHYACINTH CAUSED BY CEPHALOSPORIUM ZONATUM,
Florida Univ., Gainesville. Dept. of Plant Pathology.
R. E. Rintz.
Hyacinth Control Journal, Vol 11, p 41-44, June 1973. OWRR B-011-FLA (11), 14-31-0001-3268.

Descriptors: *Plant pathology, Aquatic plants, *Water hyacinth, Biocontrol, *Aquatic weeds, *Florida, Plant diseases.
Identifiers: *Newnans Lake (Fla), *Zonal leafspot, *Cephalosporium zonatum.

A zonal leafspot of waterhyacinth (Eichhornia crassipes) originally found in Spring Bayou in Louisiana and subsequently in Newnans Lake in Florida was found to be caused by Cephalosporium zonatum. The disease is first evident as sunken lesions on the leaf blades. Lesions gradually enlarge and become distinctly zonate. Optimum temperature for disease development and in vitro growth of the pathogen was established at 25C. Identity of the pathogen as C. zonatum was based on morphology and host range. Under artificial conditions, the pathogen affected plants of 16 genera in 12 different families. Despite its apparently wide host range, it has not been reported to occur naturally on plants other than fig in the United States. Cephalosporium zonatum appears to have some potential in biocontrol of waterhyacinth and further studies are warranted. (Morgan-Florida)
W73-15226

APHANOMYCES BLIGHT OF AMAZON SWORD PLANTS,
Florida State Dept. of Agriculture and Consumer Services, Gainesville.
W. H. Ridings, and F. W. Zettler.
Phytopathology, Vol 63, No 2, p 289-295, February 1973. 2 fig, 1 tab, 20 ref. OWRR B-011-FLA (6), 14-31-0001-3268.

Descriptors: *Plant pathology, *Aquatic weeds, Biocontrol, *Florida, Plant diseases.
Identifiers: *Amazon sword plants, *Aphanomyces blight.

An aphanomyces sp. was frequently isolated from tissues of amazon sword plants (Echinodorus brevipedicellatus) affected by a previously unrecognized disease found at an aquatic plant nursery in South Florida. Suspensions of zoospores or mycelial fragments infected 28 of 45 inoculated plants of E. brevipedicellatus. Symptoms were the same as those observed under field conditions and on plants inoculated with water taken from containers with infected plants. The following alismataceous species did not become infected when inoculated: Echinodorus 'Rangerii', E. grisebachii, E. longistylis, E. martii, Sagittaria lorata, or S. sinensis. Likewise, inoculated specimens of Hydrilla verticillata, Myriophyllum spicatum, and Alternanthera philoxeroides remained healthy. The morphology of the oogonia, oospores, antheridia, and primary and secondary zoospores of this fungus was the same as that of published descriptions of A. euteiches and the two isolates of this species used for comparison. The amazon sword plant isolate infected seedlings of Pisum sativum, Beta vulgaris, Raphanus sativum, Vicia faba, and Vigna unguiculata (sinensis). Inoculated seedlings of Lycopersicon esculentum and Avena sativa did not become infected. The two A. euteiches isolates infected seedlings of P. sativum, but failed to infect B. vulgaris, R. sativum, A. sativa, L. esculentum, or E. brevipedicellatus. (Morgan-Florida)

ANTIMICROBIAL EFFECTS OF AQUATIC PLANTS FROM MINNESOTA,
Minnesota Univ., Minneapolis. Coll. of Pharmacy.
K. L. Su, Y. Abul-Hajj, and E. J. Staba.
Lloydia, Vol 36, No 1, p 80-87, March 1973. 1 tab, 1 fig, 18 ref. OWRR A-025-MINN (8).

Descriptors: *Aquatic plants, *Minnesota, Methodology, Isolation, Mycobacterium, Microorganisms, E. coli.
Identifiers: *Skellysolve F, Filter paper, Disc diffusion method, *Antimicrobial activity, Nymphaea spp, Sparganium fluctuans, Candida albicans.

The antimicrobial activity of plant extracts against animal (Staphylococcus aureus, Escherichia coli, Mycobacterium smegmatis and Candida albicans) and plant (Alternaria sp. and Fusarium roseum) microorganisms were detected by the filter paper disc diffusion method. Ethanol (80%) extracts of Nymphaea tuberosa and Nuphar variegatum were moderately active against S. aureus, and M. smegmatis. Skellysolve F extracts of N. variegatum and Sparganium fluctuans were active against C. albicans. Ethyl gallate was isolated and identified as the antimicrobial principle from Nymphaea tuberosa, which was active against Mycobacterium smegmatis. (Walton-Minnesota)

TOXICITY, ANTI-NEOPLASTIC, AND COAGULATION EFFECTS OF AQUATIC PLANTS FROM MINNESOTA,
Minnesota Univ., Minneapolis. Coll. of Pharmacy.
K. L. Su, and E. J. Staba.
Lloydia, Vol 36, No 1, p 99-102, March 1973. 3 tab, 6 ref. OWRR A-025-MINN (9).

Descriptors: *Aquatic plants, *Toxicity, *Minnesota, Coagulation.
Identifiers: *Anti-coagulants, Anti-neoplastics, Mice, *Nymphaea spp, *Nuphar spp.

Twenty two aquatic plants collected in Minnesota were relatively nontoxic. The most toxic plant extract in Swiss Webster mice was a 50% ethanol extract of Nymphaea tuberosa stem. Alkaloids from Nuphar luteum, Nuphar japonicum and Nymphaea alba also exhibit low toxicity. The combined Skellysolve F and chloroform extract of Nuphar variegatum was active against the amelanoma tumor. National Cancer Institutes' Drug Research and Development Branch screening results of 50% ethanol extracts from the 22 aquatic plants studied were essentially inactive using the 9KB-human epidermoid carcinoma of the nasopharynx system, LE-L1210 lymphoid leukemia strains. Ethanol (50%) stem extract of Nymphaea tuberosa had slight activity against the LE-L1210 lymphoid leukemia in CDF1 mice but was also toxic. Prolongation of mice prothrombin time (PT) was observed with 80% ethanol extracts of Carex lacustris, Eleocharis smallii, Myriophyllum exalbescens, Nuphar variegatum, Nymphaea tuberosa, Potamogeton natans, Potamogeton richardsonii, Potamogeton zosteriformis, Sagittaria latifolia and Zizania aquatica, whereas a slight shortening of PT was observed in the Skellysolve F and chloroform extracts of Carex lacustris, Myriophyllum exalbescens, Nuphar variegatum and Nymphaea tuberosa. Identifiers: *Pressurized water reactors, *Environmental Impact Statements.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the continuation of construction permits and issuing of operation licenses of the Prairie Island Nuclear Generating Plant. The plant is located in Burnside Township, Minnesota, and has two pressurized-water reactors. The cooling system is operated in a closed-cycle mode receiving water from the Mississippi River. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion was to continue the construction permits and issue operating licenses for the facility subject to the following conditions: (1) Define an environmental monitoring program to determine the effects of the plant; (2) provide an analysis of effect problems and propose a course of action to alleviate the problem; (3) follow specifications to operate the cooling system on a closed-cycle mode to the maximum extent practicable. (Houser-ORNL)

Available from NTIS, Springfield, Va. 22151 as COM-72-11066 - Price $3.00 printed copy; $1.45 microfiche. PhD Thesis, December 1971. 126 p, 18 fig, 52 tab, 106 ref.

Descriptors: *Fish populations, *Channel catfish, *North Dakota, *Growth rates, Marking techniques, Surveys, Data collections, Agriculture, Fish management, Commercial fish, Biology, Ecosystems.
Identifiers: *Little Missouri River (N. Dak), Fish age determinations.

A population of channel catfish in the Little Missouri arm of Lake Sakakawea (Garrison Reservoir), North Dakota, was studied during the summers of 1968-71, to determine size, structure, growth characteristics and other vital parameters before and during commercial exploitation. A total of 4035 channel catfish were caught. The right pectoral spines from 671 to 701 fish taken in 1968 were cross-sectioned, and age determinations were made by counting annuli. During 1969-71, 2460 of 3334 fish captured were tagged and released. The age of the 1969-71 catch were approximated using year class intervals constructed on the basis of the 1968 data. Four-year-old fish were most frequently taken in 1968 and 1969, five-year-old fish in 1970, and six-year-old fish in 1971. (Woodard-USGS)

Identifiers: Annual cycles, Climatic variations, Limnology, Lakes, *Wisconsin lakes, *Eutrophication.

Detailed studies of Lakes Mendota, Monona, and Waubesa at Madison, Wisconsin, (USA) provide a comparison of their annual cycles and the influence of climatic variations on their thermal regimes. Lake Waubesa integrates the influence of wind velocity, air, temperature, and solar radiation most rapidly whereas Lake Mendota responds most slowly. Although Lake Monona is still dominated generally by climatic influences, the cultural influences of thermal discharges now causes the ice to depart in spring at a significantly earlier date than the other 2 lakes. The clarity of the Madison lakes generally decreases from Mendota to Monona to Waubesa. Although all 3 lakes are basically eutrophic dimictic lakes with anoxic conditions developing in the lower waters during summer stratification Lake Waubesa may have aperiodic overturns during summer. Comparisons of temperature, O2, Secchi disk, photometer readings, and ice thickness in Lake Mendota show relatively little change from the early studies of Birge and Juday several decades ago.--Copyright 1973, Biological Abstracts, Inc.

OCCURRENCE OF MICROORGANISMS OF DECOMPOSING ORGANIC PHOSPHORUS COMPOUNDS IN 2 TYPES OF BOTTOM SEDIMENTS OF THE EUTROPHIC LAKE JEZIORAK,
Nicolas Copernicus Univ. of Torun (Poland). Inst. of Biology.
E. Strzelczyk, W. Donderski, and W. Lewosz.
Acta Microbiol Pol Ser B Microbiol Appl. Vol 4, No 3, p 101-110. 1972. illus.
Identifiers: Arthrobacter, Bacillus, *Bottom sediments, Corynebacterium, *Decomposing organic matter, *Eutrophication, Lakes, Microorganisms, Nocardia, Phosphorus, *Poland (Lake Jeziorak), Sediments.

The generic composition of microorganisms (Bacillus, Arthrobacter, Corynebacterium and Nocardia) able to attach phenolphthalein diphosphate, glycerophosphate, lecithin, DNA and RNA was established. Different types of bottom sediments of Lake Jeziorak, Poland, contained different numbers of microorganisms capable of breakdown of these substances. The number of such organisms differed in various sampling periods.--Copyright 1973, Biological Abstracts, Inc.

SOME CLADOCERA AND COPEPODS FROM THE UPPER KLAMATH RIVER BASIN,
Arizona Cooperative Fishery Unit, Tucson.
J. C. Tash.
Northwest Sci. Vol 45, No 4, p 239-243. 1971. Map.
Identifiers: *California, *Cladocera, *Copepoda, *Oregon (Upper Klamath River), River basins.

The occurrence and distribution of some species of Cladocera and Copepoda in the Upper Kalmath River Basin (which overlaps from Oregon into California) were studied. The habitats sampled include springs, reservoirs, lakes, creeks, rivers, canals, sumps, sloughs, and an ox-box. Two-hundred and fifty samples, collected from 25 different areas during 1963-1966, were analyzed for Cladocera and Copepoda. The samples were collected with a variety of different sizes and meshes of plankton nets. Thirty-one species of Cladocera and 28 spp. of Copepoda (10 Calanoida, 5 Harpacticoida) were identified. The occurrence of species in various habitats, the number of species collected in each habitat, and the number of samples taken from each habitat are shown.--Copyright 1973, Biological Abstracts, Inc.

AQUATIC MACROPHYTES AS LIMNOLOGICAL INDICATORS,
National Museum of Wales, Cardiff. Dept. of Botany.
B. Seddon.
Freshwater Biol. Vol 2, No 2, p 107-130. 1972. Illus.
Identifiers: Aquatic flora, Indicators, Limnological studies, *Macrophytes, Species, *Eutrophication, *Trophic categories.

Species of submersed and floating-leaved aquatic macrophytes were placed in a series based on their patterns of occurrence in an ordination of floristic lists. Two chemical parameters from lake water analyses are correlated with the species assemblage in individual lakes and trophic categories are defined on the quatitative chemical characteristics of lake waters. The range and limiting tolerance of

solute content for many aquatic species are described and related to these trophic categories. Restriction towards eutrophic conditions is considered as an obligate relationship reflecting physiological demands. Some dystrophic and oligotrophic species are shown to have wide tolerance and are thought to be excluded from sites of higher trophic status by competition rather than physiological limitation.--Copyright 1973, Biological Abstracts, Inc.

5D. Waste Treatment Processes

DISPOSAL OF SUGAR REFINERY LAGOON EFFLUENTS BY SOIL SPREADING,
North Dakota State Univ., Fargo. Dept. of Bacteriology.
B. R. Funke, and F. W. Schroer.
Available from the National Technical Information Service as PB-223 906, $2.75 in paper copy, $1.45 in microfiche. North Dakota State University Water Resources Research Institute, Fargo, Report WI-221-016-73, May 1973. 7 p, 1 fig, 3 tab, 1 ref. OWRR A-019-N DAK (2).

Descriptors: *Water pollution control, *Industrial wastes, *Waste treatment, *Water reuse, *Sugar crops, Water spreading, Irrigation, Crop response, Methodology, Soil types, North Dakota, Minnesota, Alfalfa, Soybeans, Sudangrass, Waste storage, Lagoons, Recycling.
Identifiers: *Sugar refinery waste treatment, Soil spreading.

Disposal of sugar refining wastes in the Red River Valley of North Dakota and Minnesota represents a considerable problem. The present plants produce wastes with a BOD on the order of 1-2 million people equivalents annually--and more plants are being built. These wastes will have to be disposed of on land. Their disposal in water is now severely curtailed and will be completely banned in the near future. The object of these experiments was to determine the volumes of water which might be disposed of by soil spreading, the effects of these effluents on soil conditions and fertility, and the most feasible cropping to be used on such irrigated lands. Infiltration rates in Fargo clay were low and inadequate for disposing of large volumes of liquid wastes. Columns of soil in metal sleeves were planted with alfalfa, sudan grass, soybeans, and barley crops. Alfalfa, for the period of the first crop, transpired less water than soybeans and sudan grass. But cumulatively over the growing season alfalfa transpired the most water. Soybeans and sudan grass were less efficient in transpiring water. Barley was much less efficient than the other plants tested. No harmful effects on any of the plants were observed from application of the lagoon effluents. The soils showed an increase in salinity from the effluent treatments but was not considered to be serious, at least in the short run. The carbon-nitrogen ratio and pH of the soil were not significantly altered. (Woodard-USGS)

DESIGN AND CONTROL OF TRANSIENT WASTE TREATMENT PROCESSES,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
L. E. Erickson.
Available from the National Technical Information Service as PB-223 962, $2.75 in paper copy, $1.45 in microfiche. Kansas Water Resources Research Institute Contribution No. 122, July 1973. 12 p, 5 fig, 2 tab, 6 ref. OWRR A-045-KAN (2). 14-31-0001-3516.

Descriptors: Instrumentation, *Activated sludge, *Waste treatment, Biological treatment, *Waste water treatment, *Measurement, *Control systems.
Identifiers: Process dynamics, Adenosine triphosphate, Population dynamics, Transient response.

The rate at which many wastes are generated varies significantly with time. This research was concerned with the development of measurement procedures to characterize the state of the system, the development of open loop dynamic response information for the activated sludge process, and the synthesis of optimal feedback control systems for waste treatment processes. The use of adenosine triphosphate as a measurable variable to help characterize the state of the process was investigated. This variable responded rapidly to changes in cell physiological state and with the population dynamics of the culture. Important time constants in the activated sludge process have been identified and estimated from the open loop dynamic studies. Optimal feedback control theory has been applied to growth processes and results have been obtained for a completely mixed flow system.

OVERFLOW ARRANGEMENT,
W. J. Hargraves.
U. S. Patent No. 3,749,246, 3 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 912, No 5, p 1808, July 31, 1973.

Descriptors: *Patents, *Aeration, *Waste water treatment, *Sewage treatment, *Aerobic treatment, Pollution abatement, Water pollution control, Water quality control.

This invention relates to multistage aerobic sewage treatment systems and in particular to the construction of the liquid connections between the digestion stages and to the internal configuration of the stages. The system consists of a main digestion chamber with a plurality of secondary digestion chambers. Each chamber is divided into a mixing and aeration portion and a quiet portion by a suitable baffle arrangement. Each chamber has two downward facing concave baffles placed on opposite sides of the chamber. The baffles also cooperate with an upward facing concave wall and with an aerator device to mix the contents of the chamber. The liquid connection between digestion chambers is made so that there will be little or no tendency for solid material to flow from one chamber to another. This is achieved by providing specially-shaped conduit connections between a quiet portion of an upstream stage and an aerating portion of the adjacent downstream stage. The structure which defines a quiet portion should extend above liquid level to prevent floating solids from approaching the connection. Organic waste is delivered to the main chamber through an inlet, causing an increase in liquid level with the result that liquid flows sequentially through the chambers via the connectors. The liquid is thoroughly agitated and aerated in each chamber but the agitated solids do not pass through. (Sinha-OEIS)

FILTER PRESS, MORE PARTICULARLY FOR DEWATERING SLUDGE IN SEWAGE TREATMENT PLANTS,
A. Bahr.
U. S. Patent No. 3,743,100, 3 p, 9 fig, 6 ref; Official Gazette of the the United States Patent Office, Vol 912, No 1, p 153, July 3, 1973.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Sludge treatment, *Filtration, Filters, Equipment, *Pollution abatement, Water pollution control, Water quality control, Dewatering.

A filter press has belts, one at least being a filter belt extending around a drum in a closed loop. A second belt extends around the drum in a double loop the opposite closed ends of which are spaced apart. Dewatering is performed between two filter belts which extend around a drum. The outer belt engages around the inner belt with pressure, so that the filter cake can be subjected to the required pressure. The pressure can be produced either just by the tension of the outer belt or by special load applying pressure rollers. Drum speed is able to lead or lag on the speed of the belts, so that the different speeds help to break up the cohesion of the filter cake between the various inner rollers and outer rollers, greatly improving the dewatering. (Sinha-OEIS)

NEW ADSORPTION PROCESS FOR REMOVING COLOR FROM KRAFT MILL EFFLUENTS,
Rohm and Haas Co., Philadelphia, Pa. Research Div.
D. C. Kennedy.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 4, p 25-29, 1973. 1 fig, 2 tab, 6 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Adsorption, Organic wastes, Costs, Liquid wastes, Chlorides, *Color.

A new one-step, kraft pulp bleach waste treatment process has a cost-performance advantage over existing technology. This new process is based on a polymeric adsorbent. The material has no ionic groups and is not an ion exchange resin, but rather functions as a true adsorbent, removing organics from the waste effluent by Van der Waal's forces. The surface area (150 square meters per gram) and the average pore diameter (250 Angstrom units) have been optimized to give the best compromise between rapid adsorption kinetics and capacity for the organic compounds present in kraft bleach effluents. This results in a very efficient adsorption process. (Knapp-USGS)

A MULTI-POISSON DISTRIBUTION MODEL FOR THE TREATMENT OF DISINFECTION DATA,
National Environmental Research Center, Cincinnati, Ohio.
J. H. Wei, and S. L. Chang.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 39, p 115-120, 1973. 4 fig, 5 ref.

Descriptors: *Disinfection, *Water treatment, *Waste water treatment, Mathematical models, Bacteria, Viruses, *Distribution patterns, Model studies, Poisson ratio.
Identifiers: *Multi-Poisson distribution model.

The multi-Poisson distribution model was based on the concept that death of organisms in a disinfection process is a result of random collision between molecules of a disinfectant and microorganisms; the loss of infectivity of reproducibility of a clump of organisms as a survival unit is due to the cumulative destruction in the clump until the last survivor is rendered nonviable. The mathematics of the multi-Poisson distribution model, its validity in application, and the results obtained in applying it to treat bactericical and virucidal data are described. The applicability of the multi-Poisson distribution model was validated by using it in the analysis of survival curves obtained in the destruction of cysts of a free-living amoeba. (Knapp-USGS)

COMPARATIVE DEATH KINETICS OF INDICATOR MICROORGANISMS UPON HALOGEN DISINFECTION,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
L. N. Kuzminski, and T. H. Feng.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 41, p 130-134, 1973. 3 fig, 14 ref.

Descriptors: *Disinfection, *Bacteria, *Chlorine, *Bromine, Iodine, Pathogenic bacteria, E. coli, Sewage bacteria, *Waste water treatment, *Water treatment.

The relative resistances of several bacterial genera of public health significance to exposure to equivalent doses of chlorine, bromine, and iodine were evaluated. Of the six test microorganisms, Streptococcus faecalis was the most resistant to all halogens. Its resistance was at least three times greater than that of the fecal pollution indicator, Escherichia coli. (Knapp-USGS)

THE CHEMISTRY OF BROMINE CHLORIDE IN WASTE WATER DISINFECTION,
Dow Chemical Co., Midland, Mich. Halogens Research Lab.
J. F. Mills.
In: Preprint of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 43, p 137-143, 1973. 1 fig, 1 tab, 18 ref.

Descriptors: *Disinfection, *Bromine, *Chlorine, Chlorides, Bromides, Chlorination, Bacteria, Viruses, Water treatment, *Waste water treatment, Toxicity, Chemical reactions.

The chemical, biocidal and environmental properties of bromine chloride are generally more complimentary to waste water disinfection than similar properties for chlorine. The high reactivity of bromine chloride contributes to its being an efficient disinfectant of wastes with minimum environmental hazards. The predominant products formed from several competitive reactions of BrCl in waste water are harmless chloride and bromide salts. Using BrCl as the disinfectant, the small amount of bromides added to waste water effluent is well below the national standards of safe levels of bromine. (Knapp-USGS)

THE COMPARATIVE MODE OF ACTION OF CHLORINE, BROMINE, AND IODINE ON F2 BACTERIAL VIRUS,
Johns Hopkins Univ., Baltimore, Md. Dept. of Environmental Health.
V. P. Olivieri, C. W. Kruse, Y. C. Hsu, A. C. Griffiths, and K. Kasata.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 44, p 144-150, 1973. 5 fig, 15 ref.

Descriptors: *Disinfection, *Viruses, *Bacteria, *Chlorine, *Bromine, *Iodine, Water treatment, *Waste water treatment, Toxicity, Chlorination.

The halogens belong to a class of general protoplasmic poisons and are effective disinfectants for a wide spectrum of microorganisms. Their mode of action on viruses, however, appears to differ. Iodine functions through iodination of the amino acid tyrosine in the protein moiety of the virus with almost no effect on the nucleic acid even at extremely high concentrations. Bromine, although capable of inactivating the nucleic acid does not appear able to penetrate the protein. The primary mechanism is more likely involved with the viral protein. Chlorine readily inactivates the RNA in intact virus in a manner similar to the observed for the whole virus with respect to contact time and pH. (Knapp-USGS)

BROMINE DISINFECTION OF WASTE WATER EFFLUENTS,
Illinois State Water Survey, Urbana.
F. W. Sollo, H. F. Mueller, and T. E. Larson.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 45, p 151-155, 1973. 2 tab, 6 ref.

Descriptors: *Disinfection, *Viruses, *Bacteria, *Chlorine, *Bromine, *Iodine, Water treatment, *Waste water treatment, Toxicity, Chlorination, Effluents.

The efficiency of chlorine and bromine as disinfectants were compared to determine whether or not bromine might have advantages over chlorine. Bromine was somewhat more effective at pH 7.5 than at pH 6.0 and was considerably more effective at pH 9.0. This is a definite reversal of the chlorine pattern. Bromine was three times as effective as chlorine at pH 6.0, eight times as effective at pH 7.5, and 30 times as effective as chlorine at pH 9.0. Prechlorination reduced the required bromine dosage necessary to obtain a particular degree of disinfection. From these few studies, the data would indicate that prechlorination conserves bromine by satisfying the immediate demand of the effluent. (Knapp-USGS)
W73-14793

WASTEWATER DISINFECTION OF TRICKLING FILTER EFFLUENT WITH BROMINE AND CHLORINE,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
W. Sun, L. W. Little, and J. D. Johnson.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 46, p 156-159, 1973. 4 fig, 9 ref.

Descriptors: *Disinfection, *Viruses, *Bacteria, *Chlorine, *Bromine, *Iodine, *Trickling filters, Water treatment, *Waste water treatment, Toxicity, Chlorination.

Reduction in demand of tertiary treated sewage allows bromine to become the superior disinfectant at the same weight dosage as chlorine in the pH range 6-10. Since tertiary treatment of sewage for phosphate removal may soon become mandatory, this may make bromine a very attractive alternative to chlorine. Studies were carried out at Mason Farm trickling filter plant (Chapel Hill, N.C.) with tertiary sewage effluent. To decrease phosphate and the halogen demand, the secondary effluent was dosed with 200 mg/liter alum and allowed to settle. This was then disinfected with 2, 5, 10, and 20 mg/liter chlorine and bromine for determination of dosage effect. (Knapp-USGS)
W73-14794

BROMINE, CHLORINE, AND IODINE COMPARED AS DISINFECTANTS FOR AMOEBIC CYSTS,
Johns Hopkins Univ., Baltimore, Md. School of Hygiene and Public Health.
R. P. Stringer, W. N. Cramer, and C. W. Kruse.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 47, p 160-165, 1973. 2 fig, 10 ref.

Descriptors: *Disinfection, *Chlorine, *Bromine, *Iodine, *Microorganisms, *Waste water treatment, Water treatment, Chlorination, Toxicity.
Identifiers: *Amoebic cysts.

Bromine was compared with iodine and chlorine as a disinfectant for amoebic cysts in deionized distilled water and in secondarily treated sewage effluent. Variables included pH and contact time. In distilled water bromine is the superior cysticide throughout the pH range 4 to 10. Halogen species predominating below pH 7 are more cysticidal than those predominating above pH 7. In sewage effluent at pH 6 only iodine has significant value as a cysticide. At pH 8 chlorine, bromine, and iodine are equally poor cysticides. The loss of cysticidal potency of both chlorine and bromine in sewage is attributed to its affinity to combine with interfering substances. Iodine, unlike bromine the chlorine, does not have this affinity and remains free in sewage. Iodine is the best disinfectant for amoebic cysts in heavily contaminated water. The Globaline tablet which releases 8 mg/liter of iodine and releases an acidic buffer to lower water pH to from 6.5 to 7 is the best disinfectant available for emergency supplies of drinking water contaiminated with E. histolytica cysts. (Knapp-USGS)

DISINFECTION OF WATER AND WASTEWATER USING OZONE,
Crane Co., King of Prussia, Pa. Cochrane Div.
E. W. J. Diaper.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 48, p 166-169, 1973. 4 ref.

Descriptors: *Disinfection, *Bacteria, *Viruses, *Ozone, *Waste water treatment, *Water treatment, Toxicity, Costs.

Ozone is an allotropic form of oxygen with powerful oxidizing and sterilizing properties, about twice as potent as chlorine. Ozone is applied to water by means of injectors, diffusing systems or emulsion turbines which force much of the ozone into solu-

tion and into intimate contact with the impurities in the water. Ozone is effective in disinfecting water supplies by the destruction of pathogenic organisms, reducing color by oxidizing or bleaching out dissolved or collidal organic matter and eliminating taste and odor problems. Ozone costs approximately 8 cents per pound produced from air, and 3.5 cents per pound when made from oxygen (plus cost of oxygen). Installation costs range from $500 to $1000 for each pound per day of ozone generating capacity. An outstanding advantage of ozone is its immediate and effective attack on viruses in water supplies. (Knapp-USGS)
W73-14796

ECONOMICAL WASTEWATER DISINFECTION WITH OZONE,
Grace (W.R.) and Co., Baltimore, Md. Davison Chemical Div.
H. M. Rosen, F. E. Lowther, and R. G. Clark.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 49, p 170-176, 1973. 1 fig, 1 tab, 15 ref.

Descriptors: *Disinfection, *Bacteria, *Viruses, *Ozone, *Waste water treatment, Water treatment, Toxicity, Turbidity, E. coli.

Ozone is better virucide than chlorine and a much quicker bacterial disinfectant. A 10 gpm contactor was built and tested on secondary activated sludge effluents. Disinfection occurs within the 30 to 60 second retention time. Turbidity is apparently the limiting factor in efficiency. Disinfection of a municipal secondary oxygen activated sludge effluent was accomplished in 45 seconds, reaching and commonly prescribed average levels of less than 1000 total, less than 250 fecal and less than 10 Escherichia coliform per 100 ml, with a dosage of 4 to 5 mg/liter ozone. In all cases an average 40%-50% reduction of color and turbidity was also observed. (Knapp-USGS)

VIRUS INACTIVATION BY CHLORINE DIOXIDE AND ITS APPLICATION TO STORM WATER OVERFLOW,
Syracuse Univ., N.Y.
J. E. Smith, and J. L. McVey.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 50, p 177-185, 1973. 8 fig, 1 tab, 10 ref.

Descriptors: *Disinfection, Chlorine, Viruses, *Viricides, *Chlorination, Bacteriophage, *Waste water treatment, Storm drains, *Storm water, *Bactericides.
Identifiers: *Chlorine dioxide, Storm overflows.

Chlorine dioxide has greater oxidizing activity than hypochlorite. It is a more efficient bactericide. To determine the viricidal properties of C102, laboratory studies were made of the inactivation of bacteriophage and polivirus. Chlorine dioxide inactivates viruses very rapidly, and it has a wide spectrum of viricidal activity. No truly resistant virus was found and no resistant phage mutants were observed. Chloride demand by heavily contaminated water is slightly less severe for C102 than for Cl. This lengthens the working life of the disinfectant and reduces the dosage needed. (Knapp-USGS)

RECYCLE, WHAT DISINFECTANT FOR SAFE WATER THEN,
Georgia Inst. of Tech., Atlanta. Dept. of Civil Engineering.
M. A. McClanahan.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 54, p 198-208, 1973. 5 fig, 8 ref.

Descriptors: *Disinfection, *Ozone, *Chlorination, *Water reuse, *Reclaimed water, Water treatment, Chlorine, Recycling, *Waste water treatment.

Direct connection to a source of pathogenic organisms, as will occur in recycling of water, necessitates the use of the best disinfection practice available. Chlorination alone will not adequately serve to protect the consumer under the varying quality of effluent from the waste treatment processes that will be used. There are several possiblities that could be used to solve this problem; not the least of them would be improved reliability of the waste treatment process. Another would be the use of a dual disinfectant system. The most promising is ozone-chlorine. With this combination the ozone, which does not have the interferences of dissociation and reaction with ammonia that chlorine does, would provide destruction of the organisms in the raw recycled water. Because of the short life of ozone in water, chlorine would have to be added to maintain the quality of the water throughout the treatment plant and the distribution systems. (Knapp-USGS)

DECHLORINATION BY ACTIVATED CARBON,
Illinois Univ., Urbana. Dept. of Civil Engineering.
V. L. Snoeyink, and M. T. Suidan.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 55, p 209-212, 1973. 9 ref.

Descriptors: *Chlorination, *Activated carbon, Water treatment, *Waste water treatment, *Disinfection, Water chemistry, Chemical reactions.
Identifiers: Dechlorination.

Activated carbon may be used to reduce chlorine-containing compounds following superchlorination in treatment of water, or following addition of chlorine for disinfection of effluents from sewage treatment plants. An important feature of the reaction of chloramines with carbon is that N (-III) is converted to nitrogen gas so that this reaction functions to remove ammonia as well. (Knapp-USGS)

EFFECTIVENESS OF CHLORINE IN ELIMINATING BACTERIA AND VIRUSES FROM TERTIARY TREATED WASTEWATER,
Arizona Univ., Tucson. Dept. of Microbiology.
P. P. Ludovici, R. A. Phillips, and W. S. Jeter.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 57, p 218-222, 1973. 2 tab.

Descriptors: *Disinfection, *Tertiary treatment, *Water reuse, *Chlorination, Water treatment, *Waste water treatment, Bacteria, Viruses, Viricides, Water chemistry, Bactericides

Two chlorine treatments were tested for use in eliminating enteroviruses and bacteria from tertiary-treated water. Chlorination was studied in samples which were seeded with known varying concentrations of enteroviruses. Fecal streptococci were the most resistant microorganisms. The two viruses polio 1 and Coxsackie B1 were next in resistance to chlorine inactivation followed by the coliform group of organisms. Coxsackie B2 and echo 13 viruses were most sensitive to chlorine in pilot filter effluent water. However, echo 13 virus showed no increased destruction when the dose of chlorine was raised from 2 to 4 mg per liter. (Knapp-USGS)
W73-14805

DISINFECTION OF WASTEWATER EFFLUENTS FOR VIRUS INACTIVATION,
Maryland Univ., College Park
J. T. Cookson, Jr., and C. M. Robson.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 58, p 223-228, 1973. 4 fig, 1 tab.

Descriptors: *Disinfection, *Tertiary treatment, *Water reuse, *Chlorination, *Ozone, Water treatment, *Waste water treatment, Bacteria, Viruses, *Viricides, Water chemistry, Bactericides.

One of the most important processes for achieving virus removal is disinfection. Proper disinfection can provide an essentially virus free effluent. At present, only a combination of treatment processes designed to meet specific standards and followed by terminal disinfection will produce complete virus removal. The ability of terminal disinfection to produce safe water depends on the previous treatment processes and their performance in removing substances that interfere with virus disinfection. The substances that interfere with virus removal can be monitored by two general parameters: turbidity and biochemical oxygen demand. Viruses become enmeshed in suspended solids that impart turbidity to waters, allowing viruses to escape the disinfection action. It is therefore necessary that turbidity before terminal disinfection be no more than one Jackson unit. High BOD values make disinfection for virus inactivation difficult. (Knapp-USGS)

MUSKEGON SPRAYS SEWAGE EFFLUENTS ON LAND,
Environmental Protection Agency, Chicago, Ill. Region V.
E. I. Chaiken, S. Poloncsik, and C. D. Wilson.
Civil Engineering, American Society of Civil Engineers, Vol 43, No 5, p 49-53, 1973. 5 fig.

Descriptors: *Waste water reclamation, *Michigan, *Sewage effluents, *Sprinkler irrigation, *Water reuse, Agriculture, Crops, Tertiary treatment, Recycling, Soil filters, Costs, Chlorination, Social impact, Economic impact, Pervious soils, Acidic soils, Water quality, Monitoring, Waste water treatment, Financing, Use rates, Operating costs, Return (Monetary), Crop production, Waste water disposal.
Identifiers: *Muskegon (Mich.).

To eliminate discharge of polluted wastes into surface waters, Muskegon County, Michigan, is

channeling its wastewater through an irrigation network to provide water and nutrients for crops. Tertiary treatment will be effected by filtration through the soil. Hopefully the surface waters will then meet federal and state water quality standards. The combined raw sewage from all sources in western Muskegon County will be aerated in lagoons and then chlorinated before being sprayed on land. The soil-plant complex will act as a filter to remove the bulk of the nutrients, trap pathogenic bacteria, and remove other contaminants. The filtered water will then be removed by an extensive system of buried drains that will discharge it to the headwaters of streams flowing into shoreline lakes. The soils on the irrigation site, naturally low in plant nutrients and in available water holding capacities, absorb and transmit water rapidly. The local share will be paid from a $16 million bond issue. A portion of the capital costs and all of the operating costs will be recovered by a user charge based on flow. A study will be made of the marketability of effluent-grown crops. (Jones-Wisconsin)

PURIFICATION OF WASTE WATERS BY MEANS OF AERATED LAGOONS (L'EPURATION DES EAUX RESIDUAIRES PAR LAGUNAGE AERE),
J. Bebin.
Papier, Carton et Cellulose, Vol 21, No 4, p 31-41, April 1972. 3 fig, 3 illus, 1 tab, 28 ref.

Descriptors: Lagoons, *Aerated lagoons, *Waste water treatment, Water pollution treatment, *Biological treatment, Water purification, Waste water (Pollution), Water types, Effluents, Anaerobic conditions, Aerobic conditions, Temperature, Oxygen demand, Aeration, Oxygenation, Sludge, Stabilization, Control, Wastes, Erosion control, Pulp and paper industry, Algae, *Marine algae, Sludge disposal, Liquid wastes, *Pulp wastes, Industrial wastes, Treatment facilities, Engineering structures, Europe, Erosion control.
Identifiers: Kraft mills, Clarification, Residence time, Operating variables, *France (Baupte), *Sweden (Frovifors).

The four main types of effluent-treating lagoons, namely, anaerobic, aerobic, aerated, and facultatively aerated, are compared. The theoretical principle and practical operation are discussed of lagoons in commercial use, most of which are only facultatively aerated, since they do not maintain all particles in constantly agitated suspension. Operating variables discussed and pertinent calculations presented include temperature, residence time, oxygen demands, aeration or oxygenation, sludge production, ultimate clarification and stabilization needs of various industrial and domestic wastes, and lagoon design and construction parameters, such as erosion control. Two case histories of industrial lagoon installations are described, one at Etablissements Auby in Baupte, France, where gelling agents, stabilizers, and other chemicals are extracted from marine algae, the other at Orebro Pappersbruks AB. in Frovifors, Sweden, a kraft pulp and paper mill. WHITE WATER REUSE ON A FINE-PAPER MACHINE,
Western Michigan Univ., Kalamazoo. Dept. of Paper Science and Engineering.
L. C. Aldrich, and R. L. Janes.
Tappi, Vol 56, No 3, p 92-96, March 1973. 9 fig, 4 tab, 28 ref.

Descriptors: *Water reuse, *Recycling, *Water conservation, Pulp and paper industry, Discharge (Water), Closed circuits, Biochemical oxygen demand, *Industrial wastes, Waste water (Pollution), Suspended solids, Chemicals, Additives, Bioassay, Microorganisms, Aquatic microorganisms, Slime, Costs, Operating costs, Hardwood, Softwood, Effluents.
Identifiers: Fine papers, Printing papers, Paper properties, Fourdrinier machines, *White water, Paper machines, Sizing degree, Rosin, Fillers, Ash content, Papermaking, Felts (Papermaking), Western Michigan University.

Since increased reuse of paper machine waste water (white water) seems desirable both from economic and ecologic viewpoints, three continuous trial runs of 3 to 5 days' duration were conducted on the 30-inch wide experimental fourdrinier machine at Western Michigan University with 72% vs over 97% reuse of white water, corresponding to discharges of 13,000 vs less than 1300 gal per ton of paper made from a mixture of hardwood and softwood bleached kraft pulps (with 15% filler addition). Increasing the system's closure from 72 to 97% water reuse did not seriously affect the quality of the manufactured paper. After several minor changes in equipment and operating procedure, the paper differed only negligibly in strength properties, dirt content, and printability. Any differences in felt filling, pressing efficiency, and suspended solids were minor, despite increased amounts of dissolved solids in the white water. Although BOD concentrations increased, the total effluent BOD was reduced 50%. At the same time, chemical savings amounted to 18% of filler, 50% of alum, and 20% of rosin without impairment of paper opacity, mineral content, or sizing degree. These savings readily compensated for the cost of machine and operating modifications required. A bioassay of the closed water system during these runs indicated an increase in microorganism growth rate when operating temperature was raised from 90 to 110 F, but a drop in growth upon further temperature elevation to 125 F. A GENERAL PERSPECTIVE CONCERNING THE COST OF POLLUTION ABATEMENT AT ANY SPECIFIED LEVEL,
Institute of Paper Chemistry, Appleton, Wis.
R. A. Holm.
Tappi, Vol 56, No 3, p 126-130, March 1973. 5 fig, 1 tab.

Descriptors: *Pollution abatement, *Cost-benefit analysis, *Industrial wastes, *Mathematical models, Air pollution, Water pollution control, Treatment facilities, Operating costs, Capital costs, Effluents, Treatment, Water pollution treatment, Waste treatment, *Waste water treatment, Pollutants, Environmental control, Environmental engineering, Equations, Return (Monetary), Cost analysis.

A simplified mathematical model of the overall effect of antipollution treatment on the cost of pollutant capture to a specified level is presented, which is applicable to several conventional methods of air and water pollution abatement. The model uses common power law functions for the interacting and competing factors of economies of scale and diminishing returns. Two variations of the model were developed, viz., one for the relative total cost of state-of-the-art pollutant capture facilities, the other for marginal or additional cost per unit of pollutant removed in the same facilities. The relative cost of capturing or treating a given amount of pollutant is known to rise with the level of treatment. This simplified model gives approximate quantitative answers to the question of how much the cost will increase. The cost functions depend sufficiently strongly on the level of pollutant capture to emphasize the desirability of formulating equally broad fundamental relationships for the environmental quality benefits derivable from such capture or treatment. It is concluded that, over realistic ranges of parameter variation, the principle of diminishing returns dominates the system, and that the cost per unit of pollutant captured climbs strongly at higher specified treatment levels. Identifiers: Spent liquors, Sulfite mills, Chemimechanical pulping, Pulp washing, Continuous process, Combined locks, Zenith press, Process water, Presses, Thickeners, Concentrating (Process).

Dilute pulp wash waters from high-yield sodium sulfite chemimechanical pulping have been concentrated tenfold from 0.5-1.0% to 5-10% solids contents by continuous reverse osmosis in a pilot unit. This fifth field demonstration of the IPC pilot unit confirmed pollution reductions of 78-80% in five-day BOD, COD, color, and suspended solids for mill effluents discharged by Appleton Papers Inc. at Combined Locks, Wisconsin. Capital and operating cost estimates for effluent treatment by reverse osmosis in conjunction with a Zenith press appear favorable in terms of water pollution abatement, recovery of reusable process water, and recycling of recovered pulping (cooking) chemicals. Problems of membrane fouling by polysaccharides could be reduced by sustained reverse osmosis at 45C and possibly higher temperatures. (Brown-IPC)

USE OF MIXED MEDIA IN WATER PLANT FILTRATION,
Mead Corp., Kingsport, Tenn.
J. K. Sullins.
Tappi, Vol 56, No 3, p 67-68, March 1973. 2 tab.

Descriptors: *Waste water treatment, *Water treatment, *Filtration, *Industrial water, *Pulp wastes, *Filters, Turbidity, Flocculation, Water purification, Freshwater, Water types, Water quality control, Water storage, Chlorination, Hydrogen ion concentration, Water supply, *Tennessee, *Water conservation.
Identifiers: Aluminum sulfate, Microfloc filters, Paper machines, Bleach plants, Printing papers, Papermaking, Paper mills.

At Kingsport, Tennessee, the Mead Corp. produced bleached wood pulp and coated or uncoated printing papers. Because the water quality requirements of the paper machines equal those of the pulp bleaching plant, a single water quality for the entire mill is supplied by prechlorination, pH control, and alum flocculation. Installation of the No. 5 paper machine required additional filtered water and new clear well capacity. Instead of installing new filters and added storage capacity, mixed-media filter beds (supplied by Neptune Micro Floc Inc.) were installed in two of the existing six filters, operating in parallel on clear well level. Although designed for a filtration rate of 5 gal/min/sq ft, the turbidity specifications were attained even at rates above 10 gal/min/sq ft. While these two filters deliver 75% of the mill's total filtered water supply, the entire operation of the water treatment plant has been simplified. (Brown-IPC)

CONTROL OF SULPHITE PULPING WASTES IN THE UNITED STATES,
National Council of the Paper Industry for Air and Stream Improvement, Inc., New York.
H. W. Gehm.
Pure and Applied Chemistry, Vol 29, p 281-290, 1972. 1 fig, 3 tab, 22 ref.

Descriptors: *Pulp wastes, *Sulfite liquors, *Waste water treatment, *United States, Treatment facilities, Pollution control treatment, Pulp and paper industry, Biological treatment, Effluents, Activated sludge, Aerated lagoons, Waste treatment, Biochemical oxygen demand, Incineration, Byproducts, Organic compounds.
Identifiers: Sulfite mills, Spent sulfite liquors, Spent NSSC liquors, Neutral sulfite pulping, Kraft mills, Chemical recovery, Clarifiers, Fluidized beds, Acetic acid, Formic acid, Organic acids, Carboxylic acids, Soluble-base pulping liquors.

The U.S. sulfite pulp industry currently produces about 10,000 short tons daily of acid sulfite pulp and an equal amount of neutral sulfite pulp may double. Most of the spent sulfite liquors are incinerated, largely in fluidized-bed furnaces, with or without subsequent recovery of chemicals. Acid-process mills use magnesium or ammonia bases to equal extents; only one mill uses a sodium-base liquor. The fluid-bed furnace is being adapted to Mg base liquor combustion with chemical recovery. Effluents from acid sulfite mills practicing chemical recovery still contain about 20% of the original BOD load. Reductions averaging above 85% in BOD have been achieved by full-scale biological treatments of magnesium- or ammonia-base liquors in aerated basins or by the activated sludge process. Only about 10% of acid spent liquor is being converted to marketable byproducts, and the number of companies doing this is decreasing. Neutral sulfite effluents are being treated by various means. Chemical recovery plants employ either the Institute of Paper Chemistry or the Mead process. Whenever neutral sulfite mills are affiliated with kraft pulp mills, their spent pulping liquors are generally diverted to the kraft recovery system as makeup chemicals, the remaining effluents being treated by clarification and bio-oxidation. Three mills use ultimate land disposal, three others discharge their effluents to the treatment systems of large municipalities. One mill recovers formic and acetic acids, and sells the remaining raffinate to a kraft mill. (Witt-IPC)

THE 'SAVO' METHOD TREATS INDUSTRIAL PROCESS WATER.

Pulp and Paper International, Vol 14, No 9, p 35-37, Aug. 1972. 3 fig.

Descriptors: *Waste water treatment, *Treatment facilities, *Industrial wastes, *Pollution control treatment, *Pulp wastes, Suspended solids, Dissolved solids, Biochemical oxygen demand, Flocculation, Flotation, Separation, Sewage treatment, Europe, Foreign research, Combined treatment, Water conservation, Industrial water, Pulp and paper industry, Pilot plants, Effluents, Closed conduits.
Identifiers: Finland, *Savo process.

An effluent purification process which functions like an artificial kidney has been developed by Savo Oy., Finland, in cooperation with Fintraco Oy. and the Finnish Pulp and Paper Research Institute. Suspended solids and part of the dissolved solids are flocculated chemically, then separated by flotation. Pilot-plant studies indicate that over 90% of suspended solids and about 25% of dissolved matter can be removed, along with 30% BOD reductions. Advantages of the process are major savings in freshwater intake, the possibility of closing secondary water circuits, and the feasibility of treating the resulting clarified water biologically together with municipal sewage. Initially designed for treating effluents from a hardboard factory, the process was found adaptable to all kinds of pulp and paper industry waste waters, including sooty water from flue gas scrubbers. A full-scale industrial installation is under construction in the USA, and a process water treatment plant is already operating in Sweden. (Witt-IPC)

Identifiers: *Sulfite mills, Spent sulfite liquor, Bleach plants, Poland, Foam inhibitors.

Sulfite pulp mill effluents were treated for 5.0-5.5 hr with activated sludge in two laboratory aeration chambers, using different amounts of added N and P nutrients to give 5-day BOD:N:P ratios of 100:5:1 and 100:2.5:0.5, respectively. Chamber effluents were allowed to settle 1.7 hr in secondary sedimentation vats, from which the activated sludge was recycled to the aeration chambers. A 3:97 (v/v) mixture of Ca-base spent sulfite liquor and bleach plant effluent having an average 5-day BOD of 480 mg oxygen/liter (of which circa 40 mg was contributed by the bleach effluent) was treated with nutrients and neutralized to pH 7.5 with KOH, while foaming was controlled by adding 5-10 mg/liter of 'Spumol C'. Ready biodegradation occurred with both nutrient ratios, viz., BOD reductions of 92% for the 100:5:1 ratio and 91% for the 100:2.5:0.5 ratios. Amounts of excess activated sludge were significantly less with smaller nutrient additions. The foam inhibitor did not interfere with the biodegradation. Neither did the presence of ca. 3 mg/liter of active chlorine. The color intensity of the treated effluent increased by 20%. Best results, in terms of cost and treatment efficiency, were noted at activated sludge loads of 0.6 g BOD/g/day and aeration chamber loads of 2 kg BOD/cu m/day. (Stapinski-IPC)

WASTE WATER CLARIFICATION IN THE PAPER INDUSTRY THROUGH MODERN RETENTION AIDS (ABWASSERKLAERUNG IN DER PAPIERINDUSTRIE DURCH MODERNE RETENTIONSMITTEL),
Farbenfabriken Bayer A.G., Leverkusen (West Germany).
H. Tretter.
Der Papiermacher, Vol 21, No 6, p 91-95, Oct. 6, 1972. 10 fig.

Descriptors: *Waste water treatment, *Pulp wastes, *Additives, *Retention, Polymers, Cations, Zeta potential, Hydrogen bonding, Pulp and paper industry, Hydrogen ion concentration, Turbidity, Industrial wastes, Liquid wastes, Effluents, Drainage effects, Drainage, Dewatering, Flotation, Monitoring, Control systems, Instrumentation, Polyelectrolytes.
Identifiers: *Chemical recovery, Retaminol, Germany, Fourdrinier machines, Paper machines, Papermaking, White water.

A paper machine consumes 10 to 1000 liters water per kg of paper manufactured. Recovery of fibers, fillers, pigments, and other papermaking additives from the machine waste water (white water) is essential both for economic and environmental reasons. Cationic polymers, such as those marketed under the trade name 'Retaminol', act as solids-retention aids by virtue of their zeta-potential which reduces the negative potential of pulp fibers, as well as through a hydrogen-bonding mechanism. Retention aids must not be so cationactive as to interfere with the action of optical brighteners (fluorescent dyes). Most retention aids also improve the drainage of water from the pulp stock on the fourdrinier wire. Some also function as flotation aids. Their effectiveness depends on careful pH control, as well as on proper dosage. Best economic efficiency is achieved with additions of 0.05 to 0.1%, based on fiber weight, or 0.2-0.4% when accelerated dewatering is also desired. Retention aids should be added before the fiber suspension reaches the stock inlet or headbox, e.g., in the stock chest or mixing vat. Dose rates can and should be monitored by measurements of the white water turbidity. (Speckhard-IPC)

Identifiers: *Thunder Bay (Ontario), Copeland process, Clarifiers, Deicing, Pulpwood, Steam consumption, Energy consumption, Reactors, Blowers, Screw conveyors, Conveyors, Gas scrubbers, Scrubbers, Fluidized beds, Furnaces.

At Thunder Bay, Ontario, the Great Lakes Paper Co. utilizes the Copeland fluidized-bed process to burn and dispose of solid wastes and liquid effluents, such as bark, groundwood snipes, and clarifier sludge, while simultaneously generating hot water for deicing of pulpwood logs in the woodroom. This permits steam consumption to be reduced by 20,000-30,000 lb/hr. The core of the patented Copeland process is the fluid-bed reactor which operates at 1500F and is capable of incinerating dilute wastes containing as little as 30% solids without creating air pollution problems. Air blowers, air preheaters, screw conveyor discharge lines, and gas scrubbers complement the central equipment. (Witt-IPC)

sludge, Biological treatment, Incineration, Flotation, Evaporation, Aeration, Suspended solids, Filtration, Discharge (Water), Monitoring, Toxicity, Waste water (Pollution), Industrial wastes, Liquid wastes, Temperature, Hydrogen ion concentration, Aquatic life, Dissolved oxygen, Rivers.
Identifiers: Savealls, White water, Sulfite mills, Spent sulfite liquor, *Susquehanna River (Penn).

The waste disposal system installed by Charmin Paper Products Co. at its sulfite pulp and paper mill in Mehoopany, Pennsylvania, was designed to protect the water quality of the Susquehanna River. It comprises the following main features: In the pulp mill, strong (concentrated) liquid wastes undergo evaporation and combustion, while dilute wastes are aerated and flotated for suspended solids removal prior to activated sludge treatment. In the paper mill, continuous flows of excess white water are treated in savealls and recirculated. Spills are screened for removal of solids before being discharged. Problems with pH control, thermal effects, excessive spent sulfite liquor concentrations, and sluge bulking have been overcome. Conscientious water monitoring, including bioassays, indicated that high BOD removals have been attained without excessive effect on river dissolved oxygen and without noticeable harmful effects of discharged treated wastes on aquatic organisms. (Witt-IPC)

A STUDY OF RENOVATION OF PULP MILL WASTE WATER: ADSORPTION CHARACTERISTICS OF KRAFT PULP LIGNIN ON ACTIVATED CARBON, (IN JAPANESE),
Government Industrial Research Inst., Takamatsu (Japan).
H. Kabeya, T. Fujii, T. Kubo, Y. Kimura, and K. Urano.
Japan Tappi, Vol 26, No 3, p 125-130, March 1972. 6 fig, 1 tab, 6 ref. (English summary).

Descriptors: Water pollution treatment, *Waste water treatment, *Pulp wastes, *Lignins, *Activated carbon, *Adsorption, Industrial wastes, Pollutants, Pulp and paper industry, Foreign research, Kinetics, Hydrogen ion concentration, Temperature, Effluents, Aqueous solutions, Liquid wastes.
Identifiers: Kraft pulping, Alkali lignin, Japan.

The adsorption of kraft lignin (alkali lignin) from aqueous solutions (such as pulp mill effluents) by activated carbon was investigated and found to proceed very slowly. The adsorption capacity of the carbon preparation used was about 2 to 7% by weight for lignin concentrations from 1 to 40 ppm. It increased linearly with increasing pH from 7 to 11. The adsorbed lignin was not desorbed in distilled water. At temperatures between 10 and 40C, the time needed to adsorb a given amount of alkali lignin was halved by a 15-degree rise in temperature. Identifiers: Fusel oil, *Hydrolysis industry, USSR, Wood, Tulun Hydrolysis Factory (USSR), Reducing sugars, Reducing compounds, Furfural.

Residual fermentation liquor from the production of yeast is the main contributor to the pollution load of effluents from hydrolysis factories (wood saccharification plants), since it is reponsible for about 70% of the effluent's 5-day BOD. Pollution can be reduced by recycling of the residual liquor as partial replacement for hydrolysis process water. At the Tulun Hydrolysis Factory (USSR), the residual fermentation liquor constitutes 25% of the total effluent volume to be purified. Recycling reduces this volume to 18-21.8% and lowers its contribution to effluent BOD to 61.3-65%. With 25-40.5% recycled residual liquor, overall effluent BOD can be decreased to 12.5-15.3%. Thus, the 5-day BOD of residual liquor from hydrolysis with 100% freshwater was 85 kg per ton of oven-day wood. This could be reduced to 72 kg by 25% recycling, and to 65 kg by 40.5% recycling. Further measures for effluent BOD reductions include: milder intitial percolation hydrolysis conditions; decreases in losses of reducing substances during neutralization and sedimentation; combustion of fusel oil fractions; reuse of steam condensates and of residues from furfural distillation; and avoidance of liquor spills by installing automatic level indicators. (Stapinski-IPC)

RECYCLED WATER POSES DISINFECTANT PROBLEM.

Chemical and Engineering News, p 45-46. Sept. 3, 1973.

Descriptors: *Recycling, *Disinfection, *Potable water, *Water reuse, *Public health, *Waste water treatment, *Water purification, Toxin, Toxicity, Water types, Water treatment, Viruses, Bacteria, Microorganisms, Chlorine, Distillation, Ozone, Storage, Water storage, Aquatic life, Aquatic microorganisms, Coliforms, Chemicals, Organic compounds, Chlorination, Ohio River, Chemical reactions, Hazards.
Identifiers: Rhine River, Germany, Chlorine compounds.

According to M. A. McClanahan of Georgia Institute of Technology, recycled waters pose distinct health hazards as potable waters unless they are adequately disinfected. Some hazards involve viruses and the inadequacy of Escherichia coli counts as safety indicators. Other hazards involve organic residues that may react with disinfectants, such as chlorine, to form toxic, carcinogenic, mutagenic, or teratogenic compounds. Some chlorinated organics may be as persistent as halogenated pesticides. Distillation is the only treatment that can claim complete removal of all organic and biochemical residues. Ozonization is regarded as the most promising alternative, especially in conjunction with chlorination, but ozone is thermolabile and short-lived in water. Before water recycling becomes the prevalent practice, population health studies should be conducted along heavily polluted (sewage-rich) rivers, such as the Ohio and Rhine Rivers, in comparison with regions having relatively pure drinking water. In addition, all recycle systems should provide adequate storage facilities to be used when either the sewage treatment plant or the water disinfection plant breaks down. (Brown-IPC)

WASTEWATER BIOTREATMENT: WHAT IT CAN AND CANNOT DO,
Badger Co., Inc., Cambridge, Mass.
C. W. Moores.
Chemical Engineering, Vol 79, No 29, p 63-66, Dec. 25, 1972. 4 fig, 1 illus.

Descriptors: *Waste water treatment, *Biological treatment, Effluents, *Biochemical oxygen demand, Microorganisms, Dissolved oxygen, Nutrients, Growth stages, Oxidation, Recycling, Aeration, Suspended solids, Sedimentation, Growth rates, Chemical reactions, Kinetics, Treatment, Treatment facilities, Water pollution treatment.

The operating principles, parameters, capabilities, and limitations of biological waste water treatments are discussed. The main objective of 'bioconversion' is the transformation of soluble BOD components into insoluble carbonaceous solids by microorganisms. The converted solids (suspended organisms) must then be removed and disposed of by physical or physico-chemical unit operations. Bioconversion is not 100% efficient. Apart from microorganisms capable of metabolizing the waste, it requires a degradable nontoxic substrate, a source of dissolved oxygen, and trace biological nutrients. The bio-oxidation reaction shows a growth vs. time curve in which three distinct phases can be distinguished, namely, those of logarithmic, declining, and endogenous growth. Continuous bioconversion requires recycling of microorganisms. Its efficiency depends on the F/M (food-to-mass) ratio. Three aeration schemes are feasible, viz., high-rate, conventional, and extended aeration. High-rate systems yield large amounts of biosolids in relatively short aeration periods, but also high concentrations of BOD material in the effluent. Conventional systems produce lower BOD and suspended solids (usually less than 20 mg/liter) in the effluent, but require prolonged aeration. Extended aeration can yield very low BOD concentrations, but produces more suspended solids, ordinarily below 70 mg/liter. Settling of solids is best at F/M ratios of 0.2-0.5 BOD material/day/lb of MLSS (mixed-liquor suspended solids). (Witt-IPC)

Identifiers: Kraft mills, Recording instruments.

The method described is based on an equation expressing the rate of substrate utilization in continuous microorganism cultures plus the relationship between the rate of substrate utilization and the oxygen uptake under conditions of unlimited oxygen and substrate supplies. The two mathematical expressions combined give the equation, dC/dt ± gamma times X, where dC/dt is the manometrically determined oxygen uptake rate, X is the concentration of cells, and gamma is the system's activity coefficient. The latter is obtained as maximum substrate utilization rate multiplied by the constant of oxygen utilization efficiency in the given biological system. Hence by determining gamma experimentally and by measuring dC/dt, changes in the biomass of activated sludge can be controlled continuously. For a given substrate, gamma characterizes the overall activity of the microflora. A special cell for gamma determinations was constructed, in which activated sludge is saturated with oxygen, and the oxygen concentra-

tion is continuously recorded during intense mixing of sludge with the substrate. In addition to activated sludges suited for treatment of kraft pulp mill effluents, several model substrate compounds (glucose and sodium acetate) were evaluated in the cell-type apparatus. For a given activated sludge, the gamma value was found to depend on the nature of the substrate. For a given substrate, this value depended on the quality of the activated sludge, but was independent of the stage at which the sample was taken. (Stapinski-IPC)

Descriptors: *Activated sludge, *Pulp wastes, *Bleaching wastes, *Biological treatment, *Waste water treatment, Water pollution treatment, Biochemical oxygen demand, Chemical oxygen demand, Effluents, Pulp and paper industry, Color, Pilot plants, Foreign research, Suspended solids.
Identifiers: Japan.

The treatment of alkaline extraction effluents from a kraft pulp bleach plant in a laboratory activated sluge pilot plant reduced the BOD load (up to 0.8 kg/kg of mixed liquor suspended solids/day) by about 90%. The COD removal was only about 30%, and the effluent color was not significantly reduced. (See also W73-14947) (Brown-IPC)

ACTIVATED SLUDGE PROCESS IN SULPHATE PULP WASTE LIQUOR. PART II. CONTACT-STABILIZATION PROCESS AND PILOT-PLANT EXPERIMENTS,
Government Industrial Research Inst., Takamatsu (Japan).
I. Akamatsu, and H. Kamishima.
Trans. available from Institute of Paper Chemistry, Appleton, Wisconsin 54911. Price: $5.00 . Typescript translation of Japan Tappi, Vol 26, No 5, p 224-231, May 1972. 4 tab, 5 fig, 1 illus, 4 ref.

Descriptors: *Activated sludge, *Biological treatment, *Waste water treatment, Water pollution treatment, *Pulp wastes, *Bleaching wastes, Pulp and paper industry, Suspended solids, Biochemical oxygen demand, Foreign research, Pilot plants, Treatment facilities, Laboratory equipment, Nutrients, Nitrogen compounds, Phosphorus compounds, Effluents, Sedimentation, Sludge, Sludge treatment.
Identifiers: Contact stabilization treatment, Japan.

A pilot plant of 500 liter/hr capacity was used to compare the relative merits of the contact-stabilization vs the conventional activated sludge process for treatment of kraft pulp alkaline extraction (bleaching) effluents containing 2000-3400 ppm of suspended solids. Nutrient additions were varied to give BOD:N:P ratios between 200:5:1 and 300:5:1. A nutrient deficiency, i.e., reduced N and P dosage, decreased the BOD removal to 85-72%. At BOD sludge loadings below 0.5 kg/kg of mixed liquor suspended solids/day, over 90% BOD removals were achieved in both processes. However, at higher BOD loads (ca. 0.8), the conventional process attained only 86% removal compared to 90% for the contact-stabilization process. Sludge sedimentation rates were satisfactory in both processes. (See also W73-14946) (Brown-IPC)

REMOVAL OF DYES FROM WASTE WATERS (UDALENIE KRASITELEI IZ STOCHNYKH VOD),
Tsentralnyi Nauchno-Issledovatelskii Institut Bumagi, Moscow (USSR).
G. I. Leshchinskaite, V. L. Polovinkin, and V. V. Lapin.
Bumazhnaya Promyshlennost No 11, p 9-10, Nov. 1972. 1 tab.

Descriptors: Dyes, *Dye concentrations, *Water pollution sources, *Pulp wastes, *Industrial wastes, *Waste water treatment, *Toxicity, Water pollution treatment, Pulp and paper industry, Effluents, Coagulation, Adsorption, Chemicals, Additives, Clays, Polymers, Organic compounds, Polyelectrolytes, Electrolytes, Color, Retention.
Identifiers: Basic dyes, Acid dyes, Direct dyes, Aluminum sulfate, Ferric chloride, Bentonite, Fixatives, Retention aids, Coagulants, Polyethylenimine, Colored papers, White water.

More than forty different dyestuffs are in commercial use for manufacture of colored papers. Most of these are direct and basic dyes. Acid dyes are used less frequently. Dye concentrations in paper mill waste waters (white waters) vary, depending on the composition of the pulp stock and on other factors, but all of them cause water color and are toxic to aquatic life. Several methods for increasing the dye retention by papermaking fibers and/or for eliminating dye residues from paper machine effluents are available. They include coagulation of direct dyes with aluminum sulfate, ferric chloride, and other chemicals; adsorption of basic dyes on bentonites or other clays; and addition of fixatives to the pulp. Cationic retention aids or fixatives, such as polyethylenimine, work well with acid dyes; dicyandiamide-formaldehyde condensates, such as 'DTsM', are preferred for direct dyes. (Stapinski-IPC)

TREATMENT OF SODA RECOVERY BOILER FEEDWATER WITH TRILON (TRILONNAYA OBRABOTKA KOTLOVOI VODY SODREGENERATSIONNYKH AGREGATOV),
Orgbumdrev, Leningrad (USSR).
B. S. Smirnov, A. S. Rechkina, L. S. Shvaleva, and E. A. Popova.
Bumazhnaya Promyshlennost, No 9, p 20-21, Sept. 1972. 1 fig, 1 tab.

Descriptors: *Boiler feed water, *Additives, *Waste water treatment, *Pulp wastes, *Scaling, Chemical analysis, Alkalis (Bases), Hardness (Water), Iron, Metals, Phosphates, Chelation, Corrosion, Demineralization, Boilers, Industrial water, Water types, Dissolved oxygen.
Identifiers: Recovery furnaces, *Trilon B, Ethylenediamine tetraacetic acid, *USSR (Mariisk).

The feedwater charged into the soda recovery boiler at the Mariisk pulp and paper mill contains 0.3-0.5 meq of alkali, 5-10 meq of hardness components, 70-150 mg of minerals, 80-200 micrograms iron, and 20-30 micrograms oxygen per liter. Phosphates added until 1970 did not substantially control scale deposits. Trilon B gave much better control. Best results were since achieved by adding 3-4 g of EDTA (ethylenediamine tetraacetic acid) per ton of water. Iron removals achieved in consecutive months during two years of EDTA dosage are tabulated. (Stapinski-IPC)

OJI (PAPER CO.), KASUGAI MILL POSITIVELY GRAPPLING WITH ENVIRONMENTAL PROBLEM,
Oji Paper Co. Ltd., Kasugai (Japan).
M. Ishii.
Japan Pulp and Paper, Vol 10, No 1, p 37-43, April 1972. 1 tab, 3 fig, 8 illus.

Descriptors: *Treatment facilities, *Pulp wastes, Pulp and paper industry, *Pollution abatement, Water pollution treatment, Air pollution, *Waste water treatment, Sludge treatment, Incineration, Sludge disposal, Waste disposal, Odor, Sulfur compounds, Industrial wastes, Water reuse, Flocculation, Sedimentation, Aeration, Filtration, Sludge treatment.
Identifiers: *Japan, Kraft mills, Noise control, White water, Clarifiers, Savealls, Lime kilns.

The antipollution facilities at Oji Paper Co.'s kraft pulp and paper mill include the following main features: Colored waste water is treated by a patented process which involves passage through a ferrous chloride (500 g/liter) solution (wastes from a metal pickling factory) to remove 90% of the color and 60-70% of the COD. Odiferous waste water from evaporator condensates is acidified with sulfuric acid or chlorine water (bleaching waste) and oxidized in three blower-equipped aeration tanks to convert hydrogen sulfide into sulfur, methyl mercaptan into sulfonic acid, and sodium sulfide into thiosulfate plus sulfate, thus removing over 95% of odor-causing volatiles. Paper machine waste water (white water) is filtered or passed through savealls for recovery of suspended fibers, clay filler, and other solids, and then sedimented in a 24-m diameter clarifier. The supernatant is recycled as condenser cooling water. The collected total mill effluent is flocculated and precipitated with alum, lime, and a proprietary polymeric flucculant in two clarifiers which yield a treated effluent containing less than 90 ppm COD, 70 ppm BOD, and 50 ppm suspended solids. The sludge produced (30-40 oven-dry tons per day) is concentrated in centrifugal separators and sunlight-drying reservoirs prior to combustion in a rotary lime kiln. A polymeric additive aids the dewatering of chemically precipitated sludge having poor filterability. In addition to these water-related antipollution measures, the mill also provides for air and noise pollution abatement, as well as for general environmental protection through a monitoring program and an educational campaign. Installation and operating costs of all antipollution facilities are listed. They total 1.6 billion yen for capital and 39.4 million yen for operation. (Witt-IPC)

KAMLOOPS POLLUTION CURBS ARE B.C.'S MOST EXTENSIVE.

Canadian Pulp and Paper Industry, Vol 25, No 7, p 21-25, July 1972. 1 fig, 7 illus.

Descriptors: *Pulp wastes, *Pollution abatement, *Treatment facilities, *Bleaching wastes, *Waste water treatments, Water pollution, Air pollution, Sulfur compounds, Boilers, Incineration, Sludge, Wood wastes, Fly ash, Monitoring, Equipment, Recycling, Color, Effluents, Pulp and paper industry, Lagoons, Bodies of water, Sedimentation, Rivers, Lakes, Water pollution treatment, Water pollution control, Aerated lagoons, Biological treatment, Industrial wastes, *Canada, Boilers, Water conservation, Liquid wastes, Ponding, Pondage.
Identifiers: Kamloops, British Columbia, Digesters, Lime kilns, Sulfur dioxide, Exhaust gas, Scrubbers, Clarifiers, Kraft mills, Electrostatic precipitators, Process water, Turpentine, Recovery furnaces, Bleach plants, Paper machines, Dryer sections, Diffusers.

Water and air pollution abatement facilities at the recently built 1250-ton-per-day bleached kraft pulp mill of Weyerhaeuser Canada Ltd. (Kamloops, Brit. Columbia) are described. They include the following major features: A digester blow gas collector; a lime kiln capable of burning odiferous sulfur compounds; two wet scrubbers for sulfur dioxide absorption from kiln flue gas; multi-fuel power boilers capable of incinerating clarifier sludge along with wood waste; an electrostatic precipitator for fly ash removal; high furnace stacks carry-

ng steam plumes above the weather-inversion level of the valley's atmosphere; numerous air monitoring stations; a closed water system for recovery and recycling of suspended fibers and chemicals; a steam stripper and related turpentine recovery unit for keeping turpentine out of the process water and the sewered effluent; the world's largest chemical recovery boiler; a five-stage bleaching plant capable of reducing the color of effluent water; a heat and water recovery system for the dryer section of the paper machine, permitting reduced fresh water intake from the river; an 80-acre 5-day retention lagoon for biological effluent treatment; two sedimentation ponds; a clarifier; a large emergency dump pond; two diffusers for rapid effluent mixing (200:1 dilution factor) and fish protection; and a long-term river and lake survey and monitoring program. (Witt-IPC)

HEALTH CONSIDERATIONS IN RENOVATING WASTE WATER FOR DOMESTIC USE,
Hadassah Medical School, Jerusalem (Israel). Environmental Health Lab.
H. I. Shuval, and N. Gruener.
Environmental Science and Technology, Vol 7, No 7, p 600-604, July, 1973. 3 photos, 5 ref.

Descriptors: *Water reuse, *Waste water treatment, Water pollution, Water quality, Toxins, DDT, Aldrin, Chlorine, Ozone, Viricides, *Water quality standards, Toxicity, Pesticides, Public health, Enteric bacteria.
Identifiers: Chlorinitrobenzene, Orthochlorinitrobenzene, Tetralin, *Enteric virus, New Orleans, Bladder cancer, Acceptable daily intake, *Israel (Tel-Aviv), *Denver (Colo).

The possibility of waste water reuse for domestic use is being considered in some water-short areas including Denver, Colo. and Tel-Aviv, Israel. Reclaimed wastewater for human consumption may contain inorganic and organic microchemical pollutants not found in water drawn from less contaminated sources. Conventional wastewater treatment leaves many of these potentially hazardous substances unchanged. Typical drinking water standards are based on an assumption that water is drawn from groundwater or uncontaminated surface water sources; consequently, the few chemical parameters of water standards (20 for the U.S. Public Health Service, only nine of which serve as absolute grounds for rejecting a supply) do not consider many rare and little-known synthetic organic compounds and potential inorganic toxicants which could be present in wastewater. DDT, aldrin, orthochlorinitrobenzene, tetralin, and other substances, some of which are known to be toxic , have been found in river water. Carcinogens and mutagens have been found in municipal wastes. Chloronitrobenzene discharged at St. Louis, demonstrable in drinking water in New Orleans, may relate to a triple rate of bladder cancer in New Orleans. Enteric virus levels in water may be reduced by adequate levels of free available chlorine (HOCl). Ozone is a promising virucidal agent. The problem of determining acceptable daily intakes of substances for humans is discussed. It is urged that renovated water be held in batches until toxicological evaluations have been made, and that standards at least as rigorous as those for new food and drug additives should apply to water. (Stein-North Carolina)

SLUDGE RECYCLING: THE MOST REASONABLE CHOICE,
Corps of Engineers, Washington, D.C.
T. Hinesly.
Water Spectrum, Vol 5, No 1, p 1-8, 1973. 2 illus, 7 photo.

Descriptors: *Waste treatment, *Anaerobic digestion, Sewage treatment, Sludge treatment, Ultimate disposal, Waste water treatment, Water pollution, Water pollution sources, *Recycling.

There is nothing really new or unusual about the concept of returning wastewater nutrients to the soil. The growing demand for clean water may be met in some measure with the recycling of waste products that would, if left in the water, be considered contaminants and if removed, would be considered valuable soil nutrients. Municipal sludge for example, if properly stabilized, can be used as either a reconditioner of barren soils or as a fertilizer for crops. The history of waste disposal is discussed emphasizing the developing technology of waste separation and treatment. The most frequently proposed alternative to sludge recycling, that of incineration, is discussed and its disadvantages are mentioned. Case studies, involving the use of digested sludges in agricultural production, in the U.S. and in Canada are mentioned and it is suggested that in the long run, the return in the form of improved land and production will provide adequate incentives for any municipal sanitary district to investigate such recycling methods. FEEDERS SCOLDED FOR FAILING TO LEARN THEIR 'MANURE ECONOMICS'.

Beef, Vol 9, No 7, p 43 66, March, 1973, 1 fig.

Descriptors: *Farm wastes, *Economics, Cattle, *Feedlots, *Waste disposal, *Fertilizer, Texas, Irrigation.
Identifiers: Retention ponds, Playa lakes.

In these excerpts from a speech given at U.S. Department of Agriculture Southwestern Great Plains Research Center, Bushland, Texas, feedlot operators are urged to become familiar with the economics of animal wastes used as fertilizers. The approximately one ton of manure a steer produces while in the feedlot is viewed as a liability by most feeders. Manure can be an economic opportunity for the operator who the effort to turn it into a marketable commodity. (Wetherill-East Central)

CATTLE FEEDLOTS AND THE ENVIRONMENT.
Environmental Protection Agency, Seattle, Wash., Region X.

April, 1972, 63p, 35 fig, 6 tab, 8 ref.

Descriptors: *Feed lots, *Design criteria, *Air pollution, *Water pollution, *Farm wastes, Lagoons, Runoff, Waste Disposal, Pacific Northwest U.S.
Identifiers: *Waste management, Site selection, Manure mounds.

Comprehensive guidelines are presented for the control and abatement of pollution originating from cattle feedlot operations. Feedlot wastes should be considered a natural resource capable of being recycled. Proper site selection, feedlot design, and management are needed to accomplish this. Site selection is the most important factor in minimizang water pollution. Guidelines call for feedlots to be isolated from waterways and outside of a 10 year flood plain. Feedlot design should retain all wastes on the premises until ultimate disposal. This may be done by manure mounds, holding ponds, or lagoons. Land disposal is currently the only industry-wide method acceptable for ultimate disposal of feedlot wastes. (Marquard-East Central)

FACILITY DESIGN,
Wilson and Co., Salina, Kans.
R. E. Crawford.
Design for Feedlot Waste Management, Presented at the Continuing Education Seminar: Topeka, Kansas, January 23, 1969; Hutchinson, Kansas, January 28, 1969, 14 p, 9 tab.

Descriptors: *Feed lots, Runoff, Water pollution control, *Design, *Farm wastes, Livestock, Hydrology, Precipitation, *Waste water treatment, Waste storage, *Waste disposal, Irrigation.
Identifiers: *Waste management facilities.

Runoff control is an integral part of feedlot operation and cost. The principal steps are collection, storage and/or treatment and ultimate disposal. Biochemical oxygen demand, chemical oxygen demand, and dissolved oxygen data were taken to determine streamflow conditions due to feedlot runoff. Runoff variables of size of feedlot, topography, stream location, and flow and precipitation patterns were studied. At present the use of a retention system appears to be the most economical solution to preventing stream pollution with feedlot runoff. Two general plans involving holding basins of ponds are examined in detail. (Wetherill-East Central)

INCLINED-PLANE TRICKLING FILTER FOR SWINE WASTE,
Georgia Univ., Athens. Dept. of Agricultural Engineering.
L. A. Mulkey, and R. E. Smith.
Paper No. 72-952 presented at 1972 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 11-15, 1972. Order No. M172-952, 16 p, 2 tab, 1 fig, 14 ref.

Descriptors: *Waste water treatment, *Aerobic treatment, Odor, *Trickling filters, Flow rates, *Biochemical oxygen demand, *Farm wastes, *Hogs, Feed lots, Operations.
Identifiers: Inclined plane, Contact time, Organic removal, Psychoda fly larvae, Design equations.

Operating results of an aerobic inclined plane trickling filter to treat swine wastes are reported. The results indicate that this device can be used as a component in a waste handling system. The organic removal is erratic due to Psychoda fly larvae but a definite relationship exists and the equation s/so±exp (-0.03L/Q) (where s/so±BOD concen-

tration ration, L± plane length in feet and Q± flow rate in gal/hr-ft) may be used as a design guide in waste handling systems. Contact time for wastewater and biological growth is determined by tc± 17.25 L/Q. Odor control was a desirable attribute of the system and actions of macroorganisms could aid in the transport of organic solids across the inclined plane. (Marquard-East Central)
W73-15179

EQUIPMENT AND FACILITIES FOR MODERN METHODS OF SWINE MANURE DISPOSAL,
A. J. Muehling.
Reports of the Twelfth Annual Swine Day, p 17-23, December, 1970, 8 fig.

Descriptors: *Farm wastes, *Waste disposal, *Hogs, Feed lots.
Identifiers: *Building design, *Slotted floors, Farrowing house, Construction methods, Nursury building, Finishing building, Sow confinement, Hog production systems.

The use of slotted floors in swine housing has accelerated the use of confinement housing in hog production systems in the United States. Specific facilities which are necessary for swing production and which successfully employ the slotted floor are described. Detailed instructions for constructing the farrowing house, nursery building, and finishing building are given. Concrete slotted floors appear to endure better than wood or steel. However, manure probably is worked through expanded metal better than almost any other slotted floor material. All types of slotted floor materials are considered. The advantages of various constructiion materials and methods are discussed. Floor plans and pictures depict the actual building structures and give additional construction information. (Dudley-East Central)
W73-15180

CLIMATE AND THE SELECTION OF A BEEF WASTE MANAGEMENT SYSTEM,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
A. F. Butchbaker, G. W. A. Mahoney, and J. E. Garton.
Paper No. 72-410 presented at 65th Annual Meeting, American Society of Agricultural Engineers, Hot Springs, Arkansas, June 27-30, 1972, 35 p, 10 fig, 1 tab, 28 ref.

Descriptors: *Climates, *Feed lots, *Waste disposal, *Cattle, Temperature, Moisture deficit, Aerated lagoons, Management, *Waste treatment.
Identifiers: *Site selection, *Beef housing system, Anaerobic lagoons.

Climate classifications are defined and climate effects on animals and waste management systems are discussed. Two climatological models for beef housing and waste management were developed to serve as a basis for delineating areas that require different beef housing and waste management practices. One used January and July temperature limits for beef production and moisture deficit. Beef housing and waste management systems were classified by climatological areas. Essentially, more humid areas require more complete housing and waste management systems. Areas of high moisture deficit are optimum for open feedlots. Areas above 60F require sunshades, and year-around disposal of wastes on croplands can be achieved. Areas below 45F require a higher degree of housing and storage facilities for winter wastes. (Marquard-East Central)
W73-15183

NITROGEN IN INDUSTRY,
National Environmental Research Center, Cincinnati, Ohio, Advanced Waste Treatment Research Lab.
J. B. Farrell.
Presented at symposium on Nitrogen in Soil and Water, Hespeler, Ontario, Canada, March 30-31, 1971, 14 p, 2 fig, 3 tab, 13 ref.

Descriptors: *Nitrogen, Industry, *Fertilizers, *Water pollution, Ammonia, Domestic animals, Urea, Activated carbon, Chlorination, Denitrification, *Industrial wastes, *Waste water treatment, Air pollution.
Identifiers: Nitric acid.

The extent of water pollution from industrial and fertilizer production sources is examined. Nitrogen from industrial production represents only a portion of the nitrogen distributed to water. Nitrogen water pollution from industrial sources is restricted to isolated point sources. Large tonnage processes produce nitrogenous effluents in gaseous forms thus causing air pollution and not water pollution. Small tonnage production, however, can lead to large quantities of nitrogen lost. Recovery is impractival because of the economies involved in separating nitrogen from the wastes. Nitrogen may be removed biologically by changing nitrogen to ammonia or nitrates, then through chlorination, ion exchange, or FeSO4 reduction can remove nitrogen entirely or convert it to a gas. MUNICIPAL SEWAGE TREATMENT SYSTEMS--INVENTORY OF THE STRUCTURE AND FUNCTIONS OF RHODE ISLAND'S PUBLIC SEWAGE TREATMENT SYSTEMS.
Rhode Island Water Resources Board, Providence.

Water and Related Land Resources Planning Task No 4, September 1972. 198 p, 41 fig, 40 tab, 20 ref, glossary. WRC P.L. 89-80, Title III.

Descriptors: *Waste water treatment, *Planning, Coordination, Water policy, *Administration, *Rhode Island, *Sewage treatment, Treatment facilities, Regional development.
Identifiers: Waste water systems.

Structures and functions involved in the operation of Rhode Island's municipal liquid waste water facilities are described with emphasis on collection networks and treatment processes. Since all but one of the districts are municipally legislated and administered, treatment systems and collection networks are of varying sizes and efficiencies. Eleven of the fourteen systems treat waste water collected primarily from their own corporate limits. Five systems utilize a secondary treatment process, while the remaining nine employ a primary treatment process. Each system is detailed by (1) a literal description, (2) a tabular summary of population and treatment characteristics, and (3) a graphic illustration of existing and proposed collection network and treatment plant. As indicated by various proposed plans, the operation and organization of Rhode Island's sewer system should switch from single municipality systems to multi-municipality systems. Secondary treatment is also expected to become the norm, partially due to pressures from the Environmental Protection Agency. (Hoffman - North Carolina)

PRELIMINARY SEWER STUDY, VREDENBURGH, ALABAMA,
Alabama-Tombigbee Rivers Regional Planning and Development Commission, Camden.
C. W. Himes.
Report No ALA-ATR-1770-1020-01. June 1973. 20 p, 11 fig, 2 tab. RX06-1020-0.

Descriptors: *Sewerage, *Sewers, *Alabama, Environmental effects, Sewage treatment, Pumping plants, Treatment facilities, Septic tanks, Cost
Identifiers: *Gravity flow, *Vredenburgh (Ala.), Utility extension, Mill town, Sanitary sewer system.

The feasibility of constructing a gravity flow sanitary sewer system for Vredenburgh, Alabama is examined. Town economy depends upon a lumber mill. Present methods of sewage disposal by septic tanks and outdoor toilets are unsatisfactory and unsanitary due to soil limitations in terms of permeability and drainage. A proposed gravity flow system of sanitary sewers would collect and carry sewage to the west side of town. A pumping station would be required to lift sewage into a nearby treatment plant. Estimated costs would be $70,160 for the disposal system and $20,000 for the pumping station, a total of $90,160. It is anticipated that the cost of this system (including a treatment plant) versus the possible benefits would preclude serious consideration of its construction. Vredenburgh's special status as a mill town with no taxation income precludes ordinary financing arrangements. Adequacy of the water system, which has no expansion capability or plans, is also discussed. A map showing possible location of sewer lines, and profile sheets with elevations, are included. (Edwards - North Carolina)

TREATMENT AND DISPOSAL OF INDUSTRIAL WASTEWATERS,
Thames Conservancy, London (England).
H. Fish.
Effluent and Water Treatment Journal, Vol 13, No 5, p 279-289, May 1973. 3 ref.

Descriptors: *Industrial wastes, *Waste water treatment, Costs, Cooling water, *Sewage treatment, Sewerage, Water quality control, *Waste water disposal.
Identifiers: Process water, *Great Britain, Modgen formula.

Industrial wastes are divided into four categories: (1) wastewaters changed in chemical quality by the manufacturing process, (2) cooling waters not significantly altered in chemical quality, (3) grossly contaminated wastewaters, wastechemicals, and sludges separated from the main wastewater stream, and (4) runoff from roofs and yards. Only the first two categories, which form the bulk of industrial wastes, are discussed. Trade effluents may be disposed by passing them on to some enterprise which can use them, disposal to public sewers, or discharge to surface waters after extensive treatment on the premises. It is explained why British policy is to encourage discharge to public sewers. Quality limitations on industrial discharges to public sewers are discussed. Pretreatment may be necessary prior to such discharges. Attention is given to determination of charges for treatment of industrial wastes and to monitoring and control of discharges. Industrial discharges to inland surface waters are declining, groundwater discharges are rare, but discharges to tidal waters remain appropriate and necessary. Finally, pre-discharge problems and processes used by particular industries are investigated. (Stein - North Carolina)

OLLUTION OF WATER,
epartment of the Environment, London (England). Water Engineering.
. H. A. Price.
ritish Water Supply, No 2, p 6-11, February 1973.

escriptors: *Water pollution, *Water quality, 'aste water treatment, Sewage, Estuaries, iodegradation, Detergents, Alkylbenyene sulonates, *Treatment facilities.
lentifiers: *Great Britain.

roduction of wastewater increases three percent nnually in Great Britain with character of wastes eing increasingly non-biodegradable. A medium zed sewage treatment plant serving 100,000 peoe may process about 1,800 mg annually, at a cost f 100 pounds per mg. A river pollution survey reorted that half the total length of rivers in Enand and Wales were in satisfactory condition, a uarter were not seriously polluted, but needed nprovement, a sixth were of poor quality, and an ghth were grossly polluted. A slight but signifiant improvement in river quality since 1958, espite increased wastes, is due to improved treatent plants. Untreated sewage discharges into ind water are virtually nil, although estuarial ischarges cause serious pollution. Some synthetic aterials do not easily decompose biologically. lkyl benzene sulphomote used in detergents is a lassic example. Residual surface active agents in ewage effluents after normal treatment has ropped from 35% to about 5%. Experimental ork is being done on use of activated carbon in ewage treatment and on detection and determinaon of micro-pollutants in river and drinking ater. Future needs may require dual supply ystems which will supply most industry with a ater quality necessary for its requirements, eserving cleaner water for domestic purposes and elected industries such as those concerned with ood and drink. THE WATER RECLAMATION WORKS AT WINDHOEK (SOUTH WEST AFRICA),
R. J. Clayton.
Aqua, No 3, p 14-18, 1972. 8 fig, 1 tab.

Descriptors: *Municipal water, *Waste water reatment, *Potable water, *Water reuse, *Sewage reatment, Water quality, Water resources, Water hortage, Water purification, Public health, Muicipal wastes, Multiple-purpose reservoirs, Costs, Treatment facilities.
Identifiers: *Southwest Africa (Windhoek).

Few rivers in South West Africa have a water discharge during the entire year, and frequently the groundwater is brackish, creating the problem of finding new water resources to meet increasing demands. Urban growth in the capital city of Windhoek created a need to find new methods of obtaining water that had become extraordinarily expensive. With the collaboration of the NIWR (National Institute for Water Research) and CSIR (Council for Scientific and Industrial Research), a system was developed for the reclamation of sewage water. The reclaimed water meets the requirements for potable water of the World Health Organization, and it is cheaper than natural water. Windhoek is the first city in the world to permanently use reclaimed water for domestic use as drinking water. Illustrations describe existing and installation of equipment and various units and their functions in the sequence of operation. The total capital cost of the reclamation works amounts to R207.000, although it does not include the cost of five additional maturation ponds and other expenses to be shared with sewage works. (Bahre-Ariz.)

ANIMAL WASTE DISPOSAL AND CONTROL OF FEEDLOT RUNOFF.
Agricultural Research Service, Lincoln, Nebr. Soil and Water Conservation Research Div.

Typescript, October 1971. 4 p, 29 ref.

Descriptors: *Feed lots, *Waste disposal, Runoff, *Water pollution, *Soil contamination, *Farm wastes, Cattle, Odor, Groundwater, Terraces, Sedimentation, Irrigation, Water table, Nitrates, *Nebraska.

Evaluation and control of soil and water pollution from cattle feedlots and studies of the factors affecting feedlot pollution potential are the objectives of research studies initiated at Lincoln, Nebraska in 1968. Emphasis is on waterborne materials, but attention is also given to air transport and odor problems. Terrain, water table, runoff, sedimentation, nitrate concentrations, and climatic factors are studied at four test sites. Soil core samples confirm that flat feedlots are not major contributors to groundwater pollution. No problems of nitrate or salt accumulations were discovered after application of runoff effluent to corn fields. Oxidation ditch studies have shown that, with aerobic maintenance of the ditch, odors are absent. Plans have been completed for two additional research sites. (Wetherill-East Central)

Z Gesamte Hyg Grenzgeb. Vol 18, No 3, p 213-217, 1972, Illus.
Identifiers: Human wastes, Hygienic conditions, *Domestic wastes, *Waste disposal, *Recycling, Dumping, Water pollution.

The necessity of establishing a process of orderly deposition of residential waste is a consequence of the present practice of disorganized disposal. The term orderly deposition implies a stratiform deposit, with location, nature and preparation of the dumping facility in such a way that risks or nuisances in regard to water pollution and hygienic and esthetic respects are nearly fully excluded. A review is presented of 3 basic types of disposal, involving straight dumping, dumping after size reduction of solid waste, and decay processes. The basic form included deposition in pits, trenches or piles. Recycling steps and various degrees of mechanization may be incorporated.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: *Disinfection, *Bromine, *Water treatment, Chlorination, Waste water treatment, Water chemistry, Chemical reactions, Kinetics, Swimming pool.
Identifiers: *Bromamines.

Bromine functions as a disinfectant in the free form or in combined forms such as mono-, di- or tribromamine. Bromine also offers several advantages over chlorine as a disinfectant of swimming pools. Even relatively high concentrations of bromine fail to produce the eye irritation and odor found with chlorinated pools. Bromine is a superior algicide for a number of species of algae. Tribromamine, NBr3, is of particular interest because it is the most stable of the bromamines under conditions of typical breakpoint bromination. A series of experiments at pH 7.1 then showed that under conditions of reduced bromide concentration the rate of the decomposition is significantly decreased. A second order rate constant is calculated from this experiment. (Knapp-USGS)

Descriptors: *Chlorination, *Activated carbon, *Water treatment, *Waste water treatment, Disinfection, Water chemistry, Absorption, Design, Aqueous solutions.
Identifiers: *Dechlorination.

Superchlorination followed by dechlorination is commonly used in military ships and also as a means of supplying safe water to farmers or other people not connected to municipal supplies. This method of water treatment also serves as an effective means for removing those substances that cause tastes and odors. In addition, the chlorine serves as an oxident for dissolved ferrous iron with its subsequent precipitation and removal on an appropriate filter system. Dechlorination can be achieved in a number of ways, but the method most commonly used is to pass the aqueous chlorine solution over a bed of activated carbon. The chlorine is removed from solution, as well as taste and odor causing compounds, and the water is delivered to the tap free of tastes and odors associated with chlorinous organic compounds and free of bacterial contamination. Identifiers: Silver, Silver compounds, Hypochlorites, Chlorine dioxide, Chlorine compounds, *Handbooks.

The thirteen chapters of this practical handbook and engineering reference text describe the history, manufacture, and properties of chlorine (Cl), the design, operation, maintenance, and safety aspects of Cl generating equipment and chlorination installations, the determination of residual Cl in treated waters, the disinfection of drinking water, cooling water, swimming pools, industrial waste waters, and seawater, especially aboard ships, other applications of Cl in food packaging, fish and poultry processing, potato starch conversion, aluminum fluxing, pulp bleaching, and papermaking; and other disinfection methods and chemicals, notably chlorine dioxide, hypochlorite, bromine, iodine, silver, ozone, and ultraviolet irradiation. Useful nomograms and tables are appended, along with a subject index. Bibliographic citations to the pertinent literature are appended to each chapter. (Brown-IPC)

Science, Vol 181, No 4098, p 463-464, Aug 3, 1973. 2 fig, 13 ref.

Descriptors: *Chlorination, *Water purification, *Public health, Potable water, Diseases, *Bactericides, *Municipal water, *Water treatment, Dialysis, Disinfection, Water types, Hazards, Organic compounds, Biological properties, *Human diseases.
Identifiers: *Anemia, *Chloramines, Chlorine compounds, Blood, Uremia, Clinical cases, Hospitals.

Unexplained acute hemolytic anemia is sometimes found in uremic patients undergoing hemodialysis. Chloramines, which are widely used as bactericides in urban water supplies, have been found responsible for two recent epidemics of acute hemolytic anemia characterized by Heinz bodies in dialyzed uremic patients. Chloramines produce denaturation of hemoglobins both by their direct oxidant action and by their ability to inhibit red cell reductive (hexose monophosphate shunt) metabolism. (Brown-IPC)

GREAT LAKES PAPER EXTERNAL FEEDWATER SYSTEM FOR HIGH-PRESSURE BOILERS,
Great Lakes Paper Co. Ltd., Thunder Bay (Ontario).
R. H. Dahlin.
Pulp and Paper Magazine of Canada, Vol 73, No 11, p 102-104 (Technical Paper T352), Nov 1972. 4 fig, 1 tab.

Descriptors: Treatment facilities, *Boilers, *Pulp and paper industry, *Water treatment, Treatment, Filters, Equipment, Ion exchange, Anion exchange, Cation exchange, Separation techniques, Demineralization, Rivers, Running waters, Municipal water, Water types, Steam, Freshwater, Pressure, *Canada, *Waste water treatment.
Identifiers: *Kam River (Ontario), Sand filters, Feedwater, Recovery furnaces, Black liquor, Spent liquors, Kraft mills, Condensates.

The water treatment plant described makes use of sand and gravel filters, organic traps filled with high-porosity anion-exchange resins, and a demineralizer comprising both cation- and anion-

xchangers. The installation can process either iver water (from the Kam River) or city water from Fort Williams) to feed the high-pressure 850-psi) boilers in the main steam generating lant, as well as the black liquor recovery boiler of he kraft pulp mill at Great Lakes Paper Co. The acilities can also be used to polish return condenates. (Brown-IPC)

CONTROLLING IRON AND COPPER DEPOSITS IN MODERN HIGH-PRESSURE BOILERS,
J. D. McWilliam.
Pulp and Paper Magazine of Canada, Vol 73, No 11, p 53-56, Nov 1972, 4 fig, 3 tab.

Descriptors: *Additives, *Boiler feed water, *Water treatment, *Pulp and paper industry, Boilers, Neutralization, Demineralization, Ion exchange, Cation exchange, Chelation, Scaling, Organic compounds, Corrosion, Piping systems (Mechanical), Silica, Heated water, Canada, *Copper compounds, Calcium compounds, Magnesium compounds, *Iron compounds.
Identifiers: Amines, Ethylenediamine tetraacetic acid, Depostis.

In addition to conventional water treatments for removal of Si, Ca, and Mg compounds, modern high-pressure boilers, such as those used in pulp and paper mills, require treatment with neutralizing and filming amines, condensate polishers (mixed-bed demineralizers or sodium-base cation-exchange resins), as well as chelating agents to remove the corrosive Fe and Cu compounds responsible for hot-side boiler tube deposits. Practical examples of boiler feedwater treatments and boiler cleaning measures are given. Thus, heavy scales composed of 30-40% Fe oxide, 20-25% organics, and typical Ca and Mg salts in a 600-psig boiler could be significantly reduced at an Ontario pulp and paper mill by treating the feedwater (0.3 ppm hardness) with 6 ppm of ethylene-diamine tetraacetic acid (EDTA). (Brown-IPC)

THE BACTERIOLOGICAL EXAMINATION OF WATER SUPPLIES.
Department of Health and Social Security, London (England); and Ministry of Housing and Local Government, London (England).

Reports on Public Health and Medical Subjects No 71, 1969. 52 p, 3 fig, 3 tab, 3 append, 73 ref.

Descriptors: Chemistry, Chemical reactions, Bacteria, *Aquatic bacteria, Coliforms, Sampling, Technology, *Water supply, *Public health, *Water treatment, Pollutant identification.
Identifiers: *Bacterial examination, United Kingdom.

The principles of bacteriological examination and proper interpretation of the results; frequency of examinations; proper sampling procedures; and techniques to assure the efficiency of laboratory practice and comparability of results are discussed. The differentiation between water leaving the waterworks after treatment and samples taken from the distribution system is discussed since a number of factors may cause a deterioration in the supply enroute to the consumer. The importance of continual checks on the efficiency of chlorination is stressed. (Hunt-NWWA)

METROPOLITAN DISTRICT WATER SUPPLY SYSTEM, HARTFORD, CONNECTICUT: DESIGN FEATURES OF THE WATER TREATMENT PLANT AT RESERVOIR SIX,
Hartford Metropolitan District Water Bureau, Conn.
H. A. Phillips, and P. J. Revill.
Journal of New England Water Works Association, Vol 87, No 1, p 22-35, March 1973. 2 maps.

Descriptors: *Water treatment, *Treatment facilities, *Sewage treatment, *Filtration. Settling basins, Qualtiy control, *Connecticut, Sludge, Cities, Urbanization.
Identifiers: *Rapid sand filtration, Wash water, *Hartford (Conn).

Future growth of both suburban and rural communities in the Hartford region threaten the isolation of watersheds and reservoirs. This potential pollution, coupled with the continued stringency of recommended water quality standards by the U. S. Public Health Service, necessitated the decision to build a new water treatment plant at Reservoir Six. The rapid sand process of filtration was chosen because of advantages of flexibility of operation, ease of automation, reduced space requirements, and lower construction costs. Design specifications and features of the new plant, together with an explanation of the present water supply system and integration of the new plant with the existing system, are presented. The plant was designed to be built in stages. The first stage, now complete, has a nominal capacity of 20 m.g.d. The final plant will have an 80 m.g.d. design capacity. The process by which raw water is treated is detailed. Wash water and sludge from the filters is carried into decanting basins where the dirty water is allowed to clarify by settling and the supernatent water is drawn off and pumped back into the reservoir. The remaining sludge can then either be dried, put into tanks or disposed elsewhere. (Hoffman - North Carolina)

SANITARY CONDITIONS OF WELLS ON HIGHWAYS OF THE VINNITSA DISTRICT AND MEASURES TO IMPROVE THEIR WATER QUALITY, (IN RUSSIAN),
P. N. Maistruk, and G. I. Konakhovskii.
Gig Sanit, Vol 37, No 4, p 98-99, 1972.
Identifiers: *Chlorine, Highways, Sanitary conditions, *USSR, *Water wells, Water quality, Water treatment.

Immediate measures were required to improve the sanitary conditions of the wells on highways of the Vinnitsa district (USSR). One measure was the prophylactic decontamination of the water by lowering C1-releasing cartridges into the wells. The use of these cartridges filled with chlorinated lime and recharged every 30-35 days, generally had a favorable effect.--Copyright 1973, Biological Abstracts, Inc.

MAPPING HYDROCARBON SEEPAGES IN WATER-COVERED REGIONS,
Shell Oil Co., New York. (assignee)
E. R. Fort, B. O. Prescott, and A. Walters.
U. S. Patent No. 3,747, 405, 5 p, 7 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 912, No. 4, p 1315, July 24, 1973.

Descriptors: *Patents, Surveys, *Mapping, *Oil pollution, Seepage control, *Organic compounds, Water pollution control, Water quality control, *Pollution abatement, Natural resources, Oil.
Identifiers: Natural oil seepages.

A process is described for exploring a water-covered region to compose a map of concentration with areal location of hydrocarbons that seep into the water from subterranean deposits. A sampling vehicle is towed at measured distances behind the survey vessel at measured distances above the bottom of the body of water while its depth is adjusted as required to keep it generally within a selected relatively short distance above the bottom. Water is pumped to the survey vessel at a substantially constant rate and is periodically analyzed. The records can be stored in the form of digital or analog electrical or visible representations. (Sinha-OEIS)
W73-14776

METHOD OF RECOVERING OIL FROM A WATER SURFACE,
Johns-Manville Corp., New York. (assignee)
W. G. Ekdahl.
U. S. Patent No. 3,747,760, 3 p, 4 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 912, No. 4, p 1406, July 24, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, Equipment, *Separation techniques, Water pollution control, Water quality control, *Pollution abatement.

Oil on the surface of water is confined within a barrier effecting relative movement between the barrier and the water to form a head-wave along a leading edge of the confined oil which extends between the sidewalls of the barrier. The innovation comprises locating oil removal apparatus at the head-wave and removing oil from the head-wave. Oil is pumped from the surface of the water through inlets of the removal apparatus. The oil-water mixture is discharged through hoses to a barge or vessel having means to store and/or dispose of it. As oil is removed from the head-wave, the depth of the head-wave is reduced, and approaches the thickness of the remaining portion of the confined oil. The tendency of the water to scrub off globules of oil from the head-wave is minimized by reducing the profile of the oil-water interface and the pressures tending to force the oil down and beneath the barrier where the head-wave meets the barrier are also minimized. (Sinha-OEIS)
W73-14777

METHOD AND MEANS FOR THE WATER TRANSPORT OF LIQUIDS,
M. J. E. Golay, and A. H. Waite, Jr.
U. S. Patent No. 3,698,339, 7 p, 41 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 903, No 3, p 832, October 17, 1972.

Descriptors: *Patents, *Navigation, *Ice cover, *Transportation, Water pollution control, Water quality control, *Oil pollution.
Identifiers: Oil transport, Shipping.

The water transport of liquids, particularly oil through ice-choked waters, is described. A means for navigating ice-covered waters is capable of cutting through ice of substantial thickness or can travel beneath the ice in waters of adequate depth. The water transport is achieved by a submersible water craft which may be self-propelled or towed and which is separable into segments. Each segment has the ability to compensate for buoyancy and for shifting the segments one relative to the others to facilitate assembly and disassembly of a single unit. (Sinha-OEIS)

Identifiers: *USSR.

In the USSR the protection of water from contamination is regulated by the Principles of Water Legislation of the USSR and Union Republics as well as by water codes of Union-Republic water law. A brief account is given of water-conservation legislation in the USSR (in chronological order) and of major party and state decrees on water pollution control. Emphasis is placed on the role of scientific investigations in the solution of problems relating to complex use and conservation of water resources, and basic trends in the conservation of water in the USSR are outlined. The present organization of state supervision over the utilization and conservation of water is examined, and the participation of public organizations in the implementation of measures for the utilization and conservation of water is described in terms of the general nature of this assistance to state agencies. Identifiers: *Michigan 1968 Clean Water Bond Issue, Huron River Interceptor Case, Muskegon County Case, *Innovation.

This report focuses upon factors affecting innovation in the implementation of the 1968 Michigan Clean Water Bond Issue. The Joint Legislative Committee on Water Resources Planning which sized the Bond Program did not consider nutrient removal or any treatment beyond secondary in its determination of the fiscal resources necessary to meet 1980 Water Pollution Control objectives. Consequently, the fiscal resources were limited from inception. Innovation which would be responsive to changing conditions is resisted by the inherent desire for maintenance of the status quo and resistance of actions which involve uncertainity and non-programmed decision making. Administrative fragmentation provided limited perspective on the water quality problem. Technological obsolescence in administrative agencies resisted innovative solutions. An ineffective and noninnovative planning process dominated implementation of the Bond Issue funds. Four case studies demonstrating the inherent resistance to innovation led to a suboptimization of systemic pollution control goals, a reliance upon the interceptor-centralized plant model of regionalization, and basically a lack of incentives which promote planning and comprehensive analysis. The net effect of the Clean Water Bond program maintains a 1968 status quo situation. Factors resisting innovation are identified. Factors enhancing innovation are identified. An automated information storage/retrieval system for monitoring wastewater treatment facility funding is developed. Structural and process changes for future innovation are recommended.

CONTROL OF RESERVOIR EUTROPHICATION,
Fairfax County Water Authority, Annandale, Va.
F. F. Eunpu.
Journal of the American Water Works Association, Vol 65, No 4, p 268-274, 1973. 3 fig, 6 tab, 5 ref.

Descriptors: *Reservoirs, *Eutrophication, *Water quality control, *Anaerobic conditions, *Virginia, Aeration, Water pollution sources, Taste, Odor, Pollutants, Technology, Dissolved oxygen, Destratification, Annual benefits, Activated carbon, Monetary benefits, Chlorine, Hydrogen sulfide, Algal control, Copper sulfate, Manganese.
Identifiers: Fairfax County (Va.), Occoquan Reservoir (Va.).

The Fairfax County (Virginia) Water Authority embarked upon a program in 1969 to investigate methods for improving the raw water quality in its Occoquan Reservoir by eliminating existing eutrophic conditions using water aeration. The primary objective was to relieve the anaerobic conditions that existed during the summer in the lower portions of the reservoir adjacent to the water supply intake. Sampling results for temperature, dissolved oxygen, and inorganic phosphorus and nitrogen are shown. After evaluating various methods of aerating to eliminate thermal stratification, it was concluded that a reservoir turnover system would provide the desired results. Aeration of the lower portion of the Occoquan Reservoir has retarded eutrophication and provided the following benefits: elimination of anaerobic conditions and the resultant generation of hydrogen sulfide; reduction in the amount of chlorine required to oxidize organic materials; reduction in the amount of activated carbon required to combat taste and odor problems; uniform temperature and water quality at the raw water intake; some manganese removal through oxidation; ability to draw from the bottom intake because of improved quality; no prolific algal growths since aeration was begun and algicide was used in the upper areas. Identifiers: *Nutrient inactivation, *Horseshoe Lake (Wis.), Alum, Ecological impacts.

A demonstration of phosphorus inactivation by chemical precipitation was conducted in eutrophic Horseshoe Lake, Wisconsin, to determine suitable techniques, document effects of the precipitating agent on water chemistry and the algal community of the lake, and determine application costs and benefits or improvements that may accrue. Alum (aluminum sulfate) was used as a method representing an extrapolation of advanced waste treatment technology where phosphorus is removed by precipitation, sorption, and physical entrapment and sedimentation in a flocculant aluminum hydroxide precipitate. The 22-acre, 55-ft deep lake was treated in 1970 by application of approximately 11 short tons of slurried alum distributed in its upper two feet of water. Alum concentrations in the treated volume were about 200 mg/l which resulted in maximum phosphorus removal with minimal ecologic risk. The treatment results were a decrease in total phosphorus, no increase in total phosphorus in the anoxic hypolimnion during the following summer's stratification, some increase in water transparency, a short-term decrease in color, absence of nuisance planktonic blooms, improvement in dissolved oxygen, especially during the following two winters, and no observable adverse ecological consequences. Application methods, description of equipment, and costs are given. (Auen-Wisconsin)

ECONOMIC MODELS OF INDUSTRIAL POLLUTION CONTROL IN REGIONAL PLANNING,
Environmental Protection Agency, Washington, D.C. Office of Research and Monitoring.
D. P. Tihansky.
Environment and Planning, Vol 5, p 339-356, 1973. 5 fig, 2 tab, 24 ref, 1 append.

Descriptors: *Model studies, *Linear programming, *Stochastic processes, Economics, Industries, *Waste disposal, *Pollution abatement, Water quality, Streams, Treatment, Standards, Optimization, Regions, Air pollution, Constraints, *Regional analysis, Systems analysis.
Identifiers: *Nonlinear programming, Environmental quality, Regional planning.

A general theoretical model is presented for determining optimal regional growth and pollution control levels over a multiperiod time horizon. The problem is stated as the maximization of total profits of regional firms subject to constraints of ambient environmental quality and resource scarcity for production and abatement facilities. It is assumed that, in the region under consideration, maximally-allowed pollution loads are defined at sampling points in the atmosphere and streams. The model assumes that environmental quality is stochastic by incorporating variable factors of dilution or assimilation in the constraint set. This model is expressed as a stochastic nonlinear programming problem which by suitable mathematical transformations is reduced to a deterministic linear programming model; optimization problems involve the maximization of a linear profit function subject either to linear constraints, if all variables are deterministic, or nonlinear but separable constraints, if the model is extended to include stochastic features. The effects of random meteorologic and hydrologic conditions within joint chance constraints are examined, and theory on stochastic programming is developed to solve the model. Solutions to the model show the economic impacts of uniform versus efficient treatment standards, time delays on waste control enforcement, and statistical properties of the dilution factors. (Bell-Cornell)

SIMULATION AND OPTIMIZATION OF ACID MINE DRAINAGE ABATEMENT ALTERNATIVES,
Water Resources Engineers, Inc., Springfield, Va.
G. K. Young, R. S. Taylor, and J. S. Selekof.
Available from the National Technical Information Service as AD-757 782, $6.00 in paper copy, $1.45 in microfiche. Prepared for U.S. Army Corps of Engineers, Baltimore, Md., January 1973. 168 p, 52 fig, 6 tab, 22 ref, 2 append. DA CQ 31-72-C-0055.

Descriptors: *Simulation analysis, *Optimization, *Acid mine water, Drainage, *Pollution abatement, *Alternative planning, Costs, Water quality control, Standards, Mathematical models, Economic prediction, Decision making, Computers, River basins, Streamflow, Treatment, Hydrologic data, Systems analysis, *Pennsylvania, *Mine drainage.
Identifiers: *Tioga River basin (Pa.).

An approach for evaluating the water quality and economic consequences of alternative abatement plans for a river basin is presented. The approach utilizes a simulation model for acid mine drainage which is operated upon by an optimization technique. A water quality simulation model capable of routing acid mine drainage through a river basin is developed; the model simulates the quality and flow conditions resulting from different abatement programs and assesses the impact on the stream quality of abating different sources or a combination of sources. The model can monitor the water quality, measured in terms of total net alkalinity and pH, at control or decision points selected by the user. An economic optimization model is constructed which uses the simulation model as a subroutine and manipulates possible abatement alternatives. The objectives are: (1) optimum water quality at minimum annual cost; and (2) optimum water quality given an annual budget. The optimization model uses both random and deterministic techniques. The approach is applied to a case study of the Tioga River basin. (Bell-Cornell)

TRITIUM CONTROL TECHNOLOGY,
General Electric Co., St. Petersburg, Fla. Neutron Devices Dept.
W. E. Ward.
Available from NTIS, Springfield, Va., as GEPP-104; $4 in paper copy, $1.45 in microfiche. Report GEPP-104, July 1973. 22 p, 6 ref. AEC-AT- (29-2)-656.

Descriptors: *Tritium, *Waste disposal, *Radioactive wastes, *Instrumentation, Gamma rays, Absorption, Monitoring, Pollution abatement, Water pollution control, Air pollution, Cements, Underground waste disposal, Safety, Sampling, Industrial wastes, Hazards, Public health, Water vapor, Desiccants, Moisture uptake, Transfer.

Equipment for handling and containing tritium and for protection of personnel and the environment against contamination is discussed. Atmospheres are monitored by 22-liter Kanne ionization chambers, by condensing water vapor and counting with a liquid scintillation spectrometer (600 picoCuries/liter sensitivity with a 30-min counting time), or by sorption on silica gel in a portable sampler. Tritium occluded on metals is measured by mass spectrometry or by a bremsstrahlung counter. Exhaust gases are decontaminated by conversion to water vapor and adsorption on silica gel. Waste materials are placed in a burial drum and shipped by government vehicle to an AEC burial ground. Materials containing intermediate quantities (such as molecular-sieve columns) are sealed in 6-inch-diameter aluminum conduit before placing in the drum. Disposal of tritiated water by mixing with dry cement and coating with tar before burial is under study. (Bopp-ORNL)

WATER QUALITY PERCEPTION AND THE RECREATIONAL USES OF GREEN BAY, LAKE MICHIGAN,
Wisconsin Univ., Green Bay. Regional Analysis Concentration.
R. B. Ditton, and T. L. Goodale.
Water Resources Research, Vol 9, No 3, p 569-579, June, 1973. 3 fig, 5 tab, 14 ref.

Descriptors: *Recreation, Water utilization, Psychological aspects, *Lake Michigan, Regional analysis, *Water quality, *Attitudes, *Wisconsin, Recreation demand.
Identifiers: *Green Bay (Wis).

On the basis of a survey of resident heads of 3,000 households throughout the five Wisconsin counties adjacent to Green Bay, the study identified how people perceived Green Bay as a recreation resource, how these perceptions differed among groups, and how these perceptions related to recreational use patterns. Fishing, swimming, and boating ranked as the most popular activities. Participants in swimming and fishing used inland lakes more frequently than they used the Bay by ratios of 3:1 and 2:1, respectively. For boating, use between inland lakes and the Bay was equally divided. Groups differed significantly in describing the Bay and its most bothersome physical and water quality characteristics. Generally, participants and those who use the Bay were less apt to cite unpleasant smell and dead fish as major problems and more apt to cite such problems as winds, waves, and cloudiness. Comparisons between user groups showed that swimmers and boaters differed most in their perceptions of the Bay, with the former most often citing dirty water and junk on the bottom of the Bay and the latter most often citing winds and weeds. Boaters were most tolerant of unpleasant Bay conditions, swimmers least tolerant, and fishermen between the two positions. This suggests a relationship between the amount of direct water contact of an activity and the tolerance level of the activity participants. (Hoffman-North Carolina)

CONTROL OF WATER RESOURCES QUALITY: ADMINISTRATIVE ASPECTS,
Thames Conservancy, London (England).
H. Fish.
Effluent and Water Treatment Journal, Vol 13, No 1, p 31-42, January, 1973. 1 fig, 2 ref.

Descriptors: *Legislation, *Administration, *Water quality control, Water pollution, Water resources, Standards, Common law, Legal aspects.
Identifiers: Thames Conservancy (England), Lee Conservancy (England), Water Resources Act 1963 (UK), The Rivers (Prevention of Pollution Act) 1961 (UK), *United Kingdom (England-Wales).

Common law, statute law, and administrative authority dealing with water resource quality in England and Wales are surveyed. A few general principles of riparian rights are stated. The five statutes presently of greatest importance to prevention of water pollution in inland and estuarial waters are identified and discussed: (1) The Salmon and Freshwater Fisheries Act (1923), making it an offense to injure freshwater fish by dumping liquid or solid waste; (2) The Rivers (Prevention of Pollution) Act 1951 provides for maintaining or restoring the wholesomeness of rivers and coastal waters. Several sections of the act applied only to new discharges; (3) The Clean Rivers (Estuaries and Tidal Waters) Act 1960 extends river authority control to specified tidal waters; (4) The Rivers (Prevention of Pollution) Act 1961 brought under administrative control pre-1951 discharges exempted by the Rivers Act of 1951; (5) Sections 72 to 75 of the Water Resources Act 1963 provide a code for control of polluting effluents discharged into underground strata. Authority for administering inland and estuarial pollution control is vested in 27 regional river authorities, although the formation of 10 super-regional water management authorities in April, 1974 is anticipated. (Stein-North Carolina)

SEWERAGE AND SEWAGE DISPOSAL: ADMINISTRATIVE AND TECHNICAL PRINCIPLES,
Thames Conservancy, London (England)
H Fish

Descriptors: *Sewerage, Sewage treatment, Sewage disposal, *Storm runoff, *Storm drains, Tidal water, Legislation, Administration, *Combined sewers, Legal aspects, Water quality control.
Identifiers: *United Kingdom (England-Wales)

Sewerage in its historical, administrative, and legal aspects in England and Wales, and the technology of sewage collection and disposal, with emphasis on storm sewers are described. Earliest sewerage projects served the purpose of public health and attempted to recover manure for fertilizer. Currently 1300 public authorities in England and Wales are responsible for sewerage and sewage disposal. Their primary responsibilities were set in Public Health Acts of 1936 and 1961. Controls over industrial effluents were laid out in Public Health Acts of 1937 and 1961. Sewerage and sewage disposal systems in the United Kingdom fall considerably short of desirable; 30% sewage in 1970 was discharged crude, mainly to tidal waters. The problem of combined sewer systems for normal sewage and storm runoff receives much attention. Some conclusions of the 1970 Reportof the Technical Committee on Storm Overflows and the Disposal of Storm Sewage are: (1) It would be generally undesirable to construct new sewerage systems with storm overflows; (2) separation of storm overflows and surface water would be desirable in urban redevelopment; (3) Use of low side-weir type overflows should be stopped; (4) Discharge of gross solids into sewers may be controlled by use of screens; and (5) Storm overflows should be set according to a formula based on dry weather flow, population and volume of industrial effluent. Determinants of storm sewage flow are cited and methods of sewage disposal are discussed briefly. (Stein-North Carolina)

CONTROL OF WATER RESOURCES QUALITY: SCIENTIFIC AND TECHNICAL ASPECTS,
Thames Conservancy, London (England).
H. Fish.
Effluent and Water Treatment Journal, Vol 13, No 2, p 83-96, February, 1973. 4 tab, 4 ref.

Descriptors: *Water quality control, Shellfish, Airports, Groundwater, Measurement, *Water pollution, *Water quality standards.
Identifiers: Water pollution measurement, *Biotic index.

Basic to management of water resource quality are a clear grant of authority, able staff, adequate information and laboratory facilities. Water quality assessment establishes the present position, determines what controls should be exercised and evaluates the effectiveness of the control applied. The BOD levels, a Trent River Board Biotic Index of 1960, and a 1971 River Pollution Survey river classification scheme are illustrated by tables. The objective of controlling water resource quality is to obtain maximum benefit from that resource in use and environmental value. Controllable factors are discussed generally. Essential quality control measures for a river of normal uses means ensuring (1) that oxygen demand and toxic effects to local outfalls do not become excessive during lowest summer flow, (2) that loadings of non-degradable residuals do not become excessive, and (3) that total loadings of ammonia upstream of each waterworks intake during prolonged cold spells are kept low. Effluent problems of shellfish beds, airport runways, watercress beds, and groundwater are discussed. The nature of unintentional pollutions and how to cope with them by means of practical action such as clearing up of spillages, and restoring fish losses, and by instituting legal proceedings where necessary is discussed. (Stein-North Carolina)

SIMULATION MODEL FOR THE DECISION BETWEEN DILUTION OR SEWAGE TREATMENT DURING DROUGHTS,
Universidade Federal Sao Carlos, Sao Paulo (Brazil). Dept. of Hydraulics.
S. M. Villela.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 523-533, 1973. 1 fig, 3 tab, 10 ref.

Descriptors: *Droughts, *Waste dilution, *Flow augmentation, *Reservoir design, Decision making, Economics, Flow control, Low-flow augmentation, Reservoir releases, Regulation, Water management (Applied), Mathematical models.

One problem which arises when pollution of a basin reaches unacceptable levels is the decision to treat or to dilute sewage. Under regulated conditions size and location of reservoirs could be designed to reach a desired discharge distribution. This would keep the water quality above an adopted standard. Dissolved oxygen and B.O.D. were used as ecological parameters in simulation models for examination of a large number of alternative plans. First the ecological parameters were computed to eliminate plans which are not acceptable. Then, among possible solutions, computations of economics are used for optimization purposes. (Knapp-USGS)

QUO WARRANTO TO ENFORCE A CORPORATE DUTY NOT TO POLLUTE THE ENVIRONMENT,
R. Maddigan.
Ecology Law Quarterly, Vol 1, No 3, p 653-671, Summer 1971. 110 ref.

Descriptors: *Industrial pollution, *Legal aspects, *Water pollution control, *Common law, Law enforcement, Jurisdiction, Water quality standards, Governments, Legislation, Water law, Legal review, Judicial decisions, Ecology, Administration.
Identifiers: Writ of quo warranto.

In this comprehensive analysis of the doctrine of quo warranto to enforce a corporate duty not to pollute the environment, the primary argument proposed is that courts can utilize their common law powers over corporate fiduciary duties to create duties of social responsibility and such duties can be enforced through the writ of quo warranto. Since the operation of the capitalist system is based on a preference for the operation of the market rather than comprehensive government regulation and control over the manner of the operation of industry, the quo warranto writ and other result-demanding sanctions maintain an advantage over many of the proposed and existing legislative and administrative solutions. The federal alternative is discussed, since a remedy based on the equity power of fifty different state courts presents a potentially troublesome problem of non-uniformity. A federal solution would not have the uniformity problem as would a state-imposed remedy, but the federal alternative would have the same limitations as any regulatory approach to problems of pollution. NEW COMMITMENT FOR CLEANER WATER,
Senate, Washington, D.C.
J. Randolph.
Water Spectrum, Vol 5, No 2, p 9-13, 1973. 1 illus, 6 photo.

Descriptors: *Water pollution control, Permits, *Legislation, Legal aspects.
Identifiers: Federal Water Pollution Control Act Amendments of 1972.

The Water Pollution Control Act Amendments of 1972 (Amendments) represents the most significant commitment ever made by the federal government to assured supplies of water and to uncontaminated water for our country. The Amendments provide a major redirection of the Nation's program for improved water quality and are a strong assertion by Congress that water quality can no longer be allowed to deteriorate. The stated objective of the law is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters and makes as its goal the elimination of pollutant discharges into navigable waters by 1985, and accepts as an interim goal, the attainment of such water quality by 1983 as is adequate for the protection and propagation of fish, shellfish, wildlife and recreation in the waters. The Act rejects the concept that waters can assimilate substantial quantities of waste without affecting designated beneficial uses and requires that industries comply with permits requiring the installation of the best practicable control technology currently available by 1977. Also discussed are grants to public agencies for construction of sewage treatment works, the activity of the Corps of Engineers, and pollution of the Great Lakes. (Wadley-Florida)

MERCURY POLLUTION AND ENFORCEMENT OF THE REFUSE ACT OF 1899 (PART 3).

Hearings--Subcomm. of the Comm. on Government Operations, U.S. House of Representatives, 92 Cong, 2d Sess, December 1972. 108 p, 6 append.

Descriptors: Water pollution sources, Environmental effects, Water pollution control, *Mercury, *Texas, Industrial wastes, Legal aspects.
Identifiers: *Houston Ship Channel (Tex), *Refuse Act of 1899.

Testimony was taken and materials received for the record dealing with discharges by Armco Steel Corp. into the Houston Ship Channel and events subsequent to a court order enjoining further discharges. The material discharged was held to be highly toxic and to constitute an immediate threat to health, but there was some evidence to suggest that the government, due to some pressure from the White House, had attempted to negotiate a reduction in the standard imposed by the court order. Testimony was taken as to whether such a negotiation took place and if so whether it was proper. (Wadley-Florida)

EFFECTS OF OXYGEN PULPING ON TOXICITY AND COLOUR OF EFFLUENT,
H. E. Worster, and M. F. Pudek.
Pulp and Paper Magazine of Canada, Vol 74, No 3, p 95-98 (Technical Paper T93), March 1973. 11 tab, 6 ref.

Descriptors: Oxygen, *Toxicity, *Pulp wastes, *Bleaching wastes, *Color, Industrial wastes, Pulp and paper industry, Waste water (Pollution), Effluents, Liquid wastes, Water pollution, Air pollution, Bioassay, Foaming, Aeration, Fish, Aquatic animals, Resins, Pollutants.
Identifiers: Oxygen pulping, Oxygen bleaching, Delignification, Pulpwood, White water, Sulfite pulping, Kraft pulping, Linerboards, Paperboards, Sodium sulfite.

Laboratory studies suggested that the pulping of wood with alkali (NaOH) plus oxygen, or pulping

with sodium sulfite followed by delignification (bleaching) with oxygen, should impose lower water and air pollution loads on the environment than conventional kraft (sulfate) digestion. Bioassays showed that white waters from the alkali and oxygen stages, at normal loads of organic matter, are not toxic to fish, and that the white water from sodium sulfite pulp has only one-tenth the toxicity of comparable kraft pulp white water. The soda-oxygen and the sulfite-oxygen white waters also produce less color and foam during aeration than do comparable kraft effluents. Chemical analyses of various white waters indicated that their toxicity to fish increases with increased resin acid contents. Partial delignification of high-yield sodium sulfite pulps with pressurized oxygen also produced linerboard-grade pulps with properties and in yields superior to those of conventional kraft liner pulps. WATER AND SEWERAGE DEVELOPMENT PLAN, KANSAS CITY METROPOLITAN REGION.
Metropolitan Planning Commission-Kansas City Region, Mo.

(April 1971). 130 p, 19 fig, 26 tab, 16 ref. HUD supported.

Descriptors: *Planning, *Water supply, *Sewerage, Water resources, Water quality control, Water demand, Costs, *Missouri, Evaluation, Human population, Climates, Soils, *Regional development, Cities.
Identifiers: Evaluation criteria, *Kansas City (Mo).

As the basis for implementing the goals of obtaining a comprehensive water system with an adequate supply of desirable quality standards and of obtaining and maintaining efficient sewerage systems, this report consists of three main sections: (1) geography and evaluation criteria for water and sewer planning. The area has three major drainage basins created by the Missouri, Kansas and South Grand Rivers, bottomland soils, terrace or 'high bottom' soils and upland soils, and abundant yearly precipitation. For water planning purposes twice the maximum daily demand is assumed. State standards and policies are to be used as criteria for requiring degree of sewerage treatment. Provisions are to be made for public sanitary sewerage facilities in all future developments with projected urban densities; (2) a complete county-by county analysis of projected water and sewerage facility needs and project priority ratings for each county; and (3) a program for implementation. The success of the regional plan is dependent on cooperation between the counties, municipalities, and utility districts. Consequently, management of water and wastewater facilities should include one or more of the following administrative arrangements: cooperation through intergovernmental agreement; formation of a County Water and/or Sewerage Agency; a Regional or Metropolitan Water and/or Wastewater Management Agency. Comprehensive maps are included that detail water and sewer plans for each county. (Hoffman - North Carolina)
W73-15198

A PLAN FOR WATER AND SEWER, (CHATHAM COUNTY - SAVANNAH).
Chatham County-Savannah Metropolitan Planning Commission, Savannah, Ga.

Report No MPC-SN-114. May 1973. 86 p, 23 fig, 13 tab. GA-04-04-1005.

Descriptors: *Planning, *Water supply, *Sewerage, Financing, Costs, Water quality, Sewers, Urbanization, *Georgia, Utilities, Regional development.
Identifiers: Utility extension, *Savannah (Geo.), *Chatham County (Geo.).

Improvements to be made in water and sewage collection and treatment systems in Savannah-Chatham County Metropolitan Area are recommended for the period 1973 to 1985. Admittedly it is unrealistic to expect all of the recommended sewage systems to be operative by 1985. Estimates are made for the costs of new facilities and annual operations at these horizon years. Water for Chatham County comes from several wells in the Ocala Limestone aquifer west of Savannah. A lowered water table will pose salt-water intrusion problems, within 75 years. Greater dispersion of wells is recommended. Sewer collection is a problem because of flatness and isolation of developable lands by marshes. Treatment is a problem due to isolation of developable land, causing scale diseconomies. Goals related to water and sewer planning include correction of existing problems such as low water pressure, frequent failures in water distribution, and raw sewage discharges, provision of adequate water for fire protection, and elimination of effluent discharges into estuaries and canals in inhabited areas. Projected facility needs are based on population projections. Total consolidation of water and sewer systems into a unified system is not urged, but consolidated operations are, for financial and administrative reasons. Maps of ultimate sewer service areas are featured. (Stein - North Carolina)
W73-15199

INTERIM PLAN FOR WATER QUALITY MANAGEMENT IN THE DENVER METROPOLITAN AREA-ADDENDUM NO 2.
Denver Regional Council of Governments, Colo.

October 1972. 84 p, 5 fig, 1 tab, 2 append.

Descriptors: *Planning, *Design criteria, *Waste water treatment, *Management, *Decision making, *Colorado, Water quality standards, Regional development, Cities, Urbanization.
Identifiers: Waste water systems, Effluent standards, *Denver (Colo).

Current status of the Water Quality Management Program is first summarized. The area is delineated by sanitary sewer treatment areas, which are aggregated into basins and subbasins. Volume, character, and distribution of wastewater is largely determined by land use and population. Projected flows were made on this basis. Environmental, regulatory, and operational planning criteria to be used in the development and evaluation of alternative wastewater systems and in determination of the proposed areawide system are detailed. Water Quality Management Criteria, in terms of regional goals, objectives, planning premises and principles, are also listed. New discharge (effluent) standards, based on specific pollutant quantities rather than percentages of various pollutant factors, are being considered by the Colorado Water Pollution Control Commission. Environmental assessment should be on an areawide basis. Individual facilities impact on the immediately adjacent environment can be judged in terms of their compliance with areawide environmental parameters. Projects are organized by a newly defined set of major basins. The present stage of development for each project is set forth. Additional planning studies recommended are: (1) for mountain areas where effluent from small streams can have a detrimental effect on the quality of water in streams flowing into and through the Denver Metropolitan area; (2) possible storm runoff and snow melt treatment prior to entry into the stream system; (3) evaluation of the impact of industrial discharges on water quality, and (4) analysis of backwash from water treatment. (Hoffman - North Carolina)

Available from NTIS, Springfield, Va., as LA-5303-MS; $4.00 in paper copy, $1.45 in microfiche. Report LA-5303-MS, June 1973. 4 p, 7 fig.

Descriptors: *Waste treatment, *Air pollution, *Tritium, *Nuclear wastes, Absorption, Instrumentation, Moisture uptake, Automatic control, Public health.

Conversion of tritium to tritiated water vapor and absorption on molecular sieve reduced the tritium content more than 250,000-fold for gaseous effluents containing 0.5% tritium. Gas to be treated was pumped into a holding tank at about 15 psig. An automatic programmer regulated the treatment. As a safety feature the system is designed to shut down in the event of power failure. (Bopp-ORNL)

WATER POLLUTION CONTROL IN ASIA AND THE FAR EAST.
Economic Commission for Asia and the Far East (UN), New York.

Water Resources Journal, United Nations Economic Commission for Asia and the Far East (ECAFE), p 29-57, December 1972. 5 fig, 5 tab.

Descriptors: *Water pollution control, *Asia, Legal aspects, Social aspects, Economics, Planning, Water management (Applied), Water pollution sources, Water quality.
Identifiers: *Developing countries.

Water pollution control in some of the developing countries in Asia and the Far East has not received sufficient attention because of higher priorities being assigned to the attainment of self-sufficiency in the production of food grains and the provision of basic necessities of living for the population. The extent of pollution varies from moderate to serious proportions. In a number of countries, even where pollution as a whole is insignificant, there are areas where water pollution is a serious problem owing to the concentration of industry

and population. A broad technological and socioeconomic approach to pollution abatement is fundamental and can be applied in any country in the world, with due allowance being made for local conditions in arriving at final measures. (Knapp-USGS)

PRELIMINARY DATA ON BIOLOGY AND SPECIFICITY OF ACIGONA IGNITALIS HAMPS. (LEP., PYRALIDAE) ON THE HOST PLANT EICHHORNIA CRASSIPES (MART.) SOLMS LAUBACH (PONTEDERIACEAE), (IN SPANISH),
Escuela Agricola Jackson, Montevideo (Uruguay). Dept. of Entomology.
A. Silveira-Guido.
Rev Soc Entomol Argent. Vol 33, No 1-4, p 137-145, 1971, Illus, (English summary).
Identifiers: *Acigona-Ignitalis, Biological, Biology, Control, Eichhornia-Crassipes, Host, Lepidoptera, Plant, *Pontederiaceae, *Pyralidae, Specificity, Weed, *Water hyacinth.

The water hyacinth E. crassipes, a serious aquatic pest spreads rapidly wherever it establishes outside its natural area. A. ignitalis, a multivoltine insect, lays eggs normally on the leaves. Upon hatching the young larva penetrates the leaf or petiole and eats the plant tissues. Pupation takes place inside the petiole, very rarely in other spaces. Tests on host specificity were done on 14 plant species and the feeding activity compared with water hyacinth. Because A. ignitalis lived only in an aquatic environment, the behavior pattern will probably not change. On the basis of host specificity, it could be used for biological control of weeds.--Copyright 1973, Biological Abstracts, Inc.

SUCCESSIONS OF PLANKTONIC ORGANISMS IN GROUND WATER RECHARGE BASINS FED BY RIVER WATER,
M. Noll.
Arch Hydrobiol. Vol 70, No 3, p 355-378, 1972, Illus, (English summary).
Identifiers: Basins, *Germany (Rhine region), Organisms, *Planktonic populations, *Recharge basins, Rivers, Successions, Water purification, *Self purification.

Stages of purification of Rhine water in tanks linked in series are described. Many species come in with the river water. At a certain distance from the inlet, a mass development of organisms takes place in the longest basin. Further on there is a decline. The basin farthest from the inlet is characterized by a variety of organisms which are not found in the Rhine, West Germany. By considering the whole complex, it can be shown that, depending on the distance and velocity of the water, a biological self-purification takes place which manifests itself in its chemical composition as well as in its organisms populations.--Copyright 1973, Biological Abstracts, Inc.

W. C. Walton.
Available from the National Technical Information Service as PB-223 872, $4.75 in paper copy, $1.45 in microfiche. Bulletin 64 1973. 46 p. OWRR A-028-MINN (1). 14-31-0001-4023.

Descriptors: Water resources, *Research, *Biographies, *Minnesota, *Universities, Colleges, Education, Training, *Scientific personnel, Manpower.
Identifiers: *Directory.

This directory provides a listing of University of Minnesota and State and Private Colleges in Minnesota faculty having specialized training and research experinece in fields directly related to water resources. In May 1973, 194 faculty members were requested to submit a short biographical sketch to the Water Resources Research Center for use in preparing this directory. Information received from 74 faculty is included in this directory. Faculty who did not submit biographical sketches are listed with names, affiliations and addresses. The directory consists of an alphabetized list of the faculty members, their departments, education, and experience. No attempt has been made, however, to be complete in listing publications, research, or other information. A keyword index has been provided to assist in locating faculty having particular specialties. There are faculty members with training and experience in all of the various fields directly related to water resources. Biologists are particularly numerous followed by Chemists, Geographers, Agricultural Engineers and Soil Scientists, Ecologists, Sociologists, Public Administration and Political Scientists, and Economists. There are few Lawyers, Sanitary Engineers, Limnologists, Hydrologists, Hydraulic Engineers, Hydrogeologists, Forest Hydrologists, Climatologists, and Recreation Scientists.

Identifiers: *Capacity expansion, Economic analysis, *Sequencing, Cost minimization, Permutations, Sensitivity analysis.

A multidimensional sequencing problem frequently found in the planning of capacity expansion in large-scale water resources system is solved using a dynamic programming algorithm. The algorithm utilizes the imbedded state space concept in order to effect a reduction of dimensionality making it possible to efficiently solve problems of the dimension encountered in real-world water resource systems. Specifically, the sequencing problem involves the determination of the minimum discountered cost sequence for the construction of a set of high cost multiple-purpose water resources projects, which in aggregate, must supply a number of time-varying, water-related, demand requirements over a specified planning horizon. Computational experience with the imbedded state space dynamic programming algorithm on the solution of a number of two- and three-dimensional sequencing problems from several real-world water resources systems is reported. The results of a sensitivity analysis on these data are also presented. (Bell-Cornell)

Descriptors: *Evaluation, *Standards, *Water quality standards, *Project planning, *United States, *Federal government cost-benefit analysis, Land resources, Planning, Costs, Ecology, Interest rates, Cost sharing, Pricing, Economics, Resources development, Natural resources, Regional development.
Identifiers: *Water Resources Council.

The 'Principles and Standards for Planning Water and Related Land Resources' proposed by the Water Resources Council (WRC) (Federal Re-

gister, Vol 36, No 245, Part II, p 24144) are criticized as encouraging inefficient projects and neglecting harmful environmental impacts. The prescription of benefit estimation techniques is deemed inadequate and said to ignore certain significant opportunity costs, especially those related to the delcterious ecological effects attributable to a project. The explicit judgments made in the 'Principles and Standards' adjust economic parameters in the direction of inefficient choices, e.g., unjustifiably low interest rates. Implicit judgments necessary for implementing regional developments, as well as equity accounts are left to agency planning without adequate guidelines. By not considering cost-sharing and pricing policies as integral parts of the evaluation process, the 'Principles and Standards' are not likely to encourage efficient and equitable programs. The cumulative effect of the above deficiences is claimed to bias public decisions toward excessively large water and land resource development programs. (Brown-IPC)

MATHEMATICAL MODELING OF URBAN WATER MANAGEMENT STRATEGIES,
Colorada State Univ., Fort Collins. Dept. of Agricultural Engineering.
W. R. Walker.
Available from the National Technical Information Service as PB-223 895, $5.50 in paper copy, $1.45 in microfiche. Ph.D. Dissertation, August 1973. 191 p, 43 fig, 4 tab, 57 ref, 2 append. OWRR B-071-COLO (5).

Descriptors: *Institutional constraints, *Mathematical models, *Optimization, Systems analysis, *Urbanization, Waste water treatment, *Water management (Applied), Water quality, *Water supply, Algorithm, *Colorado, Water reuse, Recycling, Water rights, Inter-basin transfers, Decision making, Alternative planning.
Identifiers: *Denver (Colo).

The rapid expansion of many western urban centers has nearly outstripped available stream flow and groundwater resources requiring municipal water departments to initiate exhaustive searches for new water supplies. Among the most feasible alternatives being investigated to date are acquisition and transfer of agricultural rights, interbasin water diversions, and wastewater recycling. A management level urban water system model has been formulated in which a system analysis format is employed to answer some of the basic questions concerning the optimal combination of these alternative supplies. The model incorporates a nonlinear differential optimization algorithm to coordinate urban water supply, distribution, and wastewater management. A test of the model's utility is made in an application to the water management problems of the Denver, Colorado metropolitan area. Denver has utilized both agricultural transfers and transmountain diversions to supplement the natural stream resources of the South Platte River. Plans are being made to increase the capacity of these sources, increasingly stringent standards on the area's effluents are enhancing the feasibility of reclaiming and recycling a portion of the wastewater. The urban model used in this study indicates the decision points at which respective strategies are introduced. By formulating the model from a planner's viewpoint, the most important results gained from the analysis are the costs of various institutional constraints which may restrict the decision makers' ability to implement optimal policies.

Available from the National Technical Information Service as PB-223 961, $8.25 in paper copy, $1.45 in microfiche. PhD Dissertation, 1973. 108 p, 23 fig, 17 tab, 23 ref. OWRR B-007-FLA (7). 14-31-0001-3267.

Descriptors: *Water allocation (Policy), Water values, Water utilization, Water demand, Decision making, *Water control, *Water policy, *Florida, Flood control, *Model studies, Institutional constraints, River basin development, Water storage, Management, Regions.
Identifiers: *Upper Kissimmee River basin (Fla).

This study suggests simulation as a means of considering alternative policies for an existing water control system. Specifically, the problem of dealing with the formulation of water management policy for the area of south Florida within the Central and Southern Florida Flood Control District was undertaken. The objectives were to (a) propose an organizational framework in which hydrologic, economic, and institutional aspects of the region may be used in policy development, (b) develop a simulation model which includes the salient hydrologic, economic, and institutional features of the Upper Kissimmee River Basin to serve as a guide, (c) demonstrate the usefulness of the simulation model in policy evaluations, and (d) determine the appropriateness of the approach for use in policy problems encountered when dealing with a large region. A first-generation simulation model of the hydrologic phenomena and water-oriented activities in the Upper Kissimmee River Basin was developed. Models of the surface water management system, the water use activities, and the institutional constraints were interfaced with rainfall and watershed runoff models. The model of the surface water management system included submodels of the gate-type control structures, the canal systems, and the water storage system. The water use activities model was made up of submodels for crop irrigation, residential water consumption, and property flooding. The institutional constraint model included sub-models of lake surface elevation, consumptive withdrawal, and minimum flow regulations. (Morgan-Florida)

A COMPUTER-IMPLEMENTED INSTRUCTIONAL GAME FOR EVALUATING WATER MANAGEMENT ALTERNATIVES,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Fisheries and Wildlife Sciences.
R. T. Lackey.
Available from the National Technical Information Service as PB-223 966, $7.75 in paper copy, $1.45 in microfiche. Virginia Water Resources Research Center Completion Report, July 1973, 112 p, 1 fig, 1 tab, 8 ref. OWRR A-049-VA (1).

Descriptors: *Education, *Multiple-purpose reservoirs, Training, Lakes, Reservoirs, Impoundments, Model studies, *Computer models, Fisheries, Wildlife, Recreation, Hydroelectric power, Water management (Applied), *Virginia.
Identifiers: *Smith Mountain Lake (Va), Roanoke River (Va).

Computer-implemented learning exercises involving large system management should become an important natural resource educational tool. One such teaching game, DAM, illustrates the principles of managing a large multiple-use reservoir system. Stages in the development of DAM were: (1) model conceptualization, (2) model quantification and implementation, and (3) model refinement. The finished product is based on the use of economic and quantity numerical accumulators and a random number generating function. Management realism and role switching enhance DAM's value as a tool for acquainting students with management based on total system understanding.

Available from the National Technical Information Service as PB-223 971, $4.25 in paper copy, $1.45 in microfiche. Partial Completion Report, New York Water Resources and Marine Sciences Center, Ithaca and Cornell University Agricultural Experiment Station, Technical Report No. 19, A. E. Res. 296, August, 1969, 102 p, 19 graphs, 24 tab, 15 ref, 1 append. OWRR B-002-NY (6).

Descriptors: Reservoirs, *Recreation, *Value, *Benefits, *Recreation demand, Surveys, Evaluation, Resource allocation, Decision making, Alternative planning, *New York, Investment, Market value, Political aspects, Social aspects, Systems analysis, Model studies.
Identifiers: *Public resources, Public objectives, Benefit estimation, *Whitney Point Reservoir (NY), Broome County (NY).

The purpose of recreation benefit estimation is to facilitate comparisons between recreation and alternative public investiment opportunities. It provides a means to answering the important question of how scarce public resources should be alloted to activities for which there is no market indicator of value. Some methods of recreation benefit estimation are compared. Stressed are the relative advantages and limitations of the different techniques; an attempt is made to place them in a perspective that increases their utility in decision-making processes. Comparisons are based upon data collected in a survey of recreationists at Whitney Point Reservoir, Broome County, New York, during the summer of 1966. Recreation development in this area has required a significant expenditure of public resources, as well as sacrifice in the flood control capability of a dam. These development costs, justified with little idea of benefits that would result, are an example of the need for improving techniques of recreation benefit estimation. It is concluded that benefit estimation methods differ in sensitivities to environmental and social forces, and in definitions of what is appropriately measured; future research should seek to clarify difference, to explore for the real meanings of different valuation methods - which methods apply to which public objectives. SOCIAL/ENVIRONMENTAL SYSTEMS FOR REGIONAL DEVELOPMENT PLANNING,
Minnesota Univ., St. Paul. Dept. of Agricultural and Applied Economics.
W. R. Maki.
Available from the National Technical Information Service as PB-223 931, $3.75 in paper copy, $1.45 in microfiche. University of Minnesota, Water Resources Research Center Mimeographed Report 1973. 29 p, 1 fig, 1 tab, 43 ref. OWRR B-044-MINN (2). 14-31-0001-3293.

Descriptors: *Regional development, Resources, Water resources, Minnesota, Planning, Investment, *Input-output analysis, Model studies, Regional analysis, *Resource allocation, Water users, Computer models.
Identifiers: Producer, Provider system, Service delivery sub-model, Consumer, User system, Social, Environmental service delivery, *Upper midwest region, Capital improvements.

Information needs for implementing public programs of resource use and control are discussed. Economic models for producing the needed data are presented as activity components of an extensive computer modeling capability. The activity components are building blocks in the construction of a workable system for relating research findings to management and policy questions in regional development. A series of activity components are presented as elements of a regional system; these elements are identified as follows: population, demand, output and employment, earnings and income, capital improvements and financing, facility location, land use, environmental management, public financing and public policy. (Walton-Minnesota)

FINANCING ALTERNATIVES FOR REGIONAL RESOURCE DEVELOPMENT,
Minnesota Univ., St. Paul. Dept. of Agricultural and Applied Economics.
W. R. Maki.
Available from the National Technical Information Service as PB-223 913, $2.75 in paper copy, $1.45 in microfiche. University of Minnesota, Water Resources Research Center Mimeographed Report, April 14, 1973. 16 p, 1 fig, 6 tab, 20 ref. OWRR B-044-MINN (1). 14-31-0001-3293.

Descriptors: *Resources development, *Financing, *Minnesota, Water resources, Planning, *Regional development, *Project planning, *Investment, Community development.
Identifiers: *Area development accounts, Capital improvements.

To help in developing and testing alternative approaches to resource development, a multi-county study area was selected in West Minnesota. This area is part of a hierarchy of development planning regions and subregions which make up the Upper Midwest Region. Financing gaps exist, not only for municipal water and sewer facilties construction, but also for capital improvements in areawide environmental management and multi-area basinwide resource development. Area capital improvements budgets are needed for each government function which include a listing of high priority projects for attaining area and community goals. The first task in assessing financing alternatives was therefore, the preparation of a set of area development accounts. The area development accounts were transformed into area development issues by a series of maps which show the time scheduling and the place location of proposed development projects. The project sponsors and others affected by proposed program of capital improvements are able to identify the specific time and place in which their interests are endangered, or reinforced, by the proposed development program. Financing alternatives for area resource development also were provided in the area development accounts. These alternatives would include a combination of federal, state and local income sources and financing arrangements. Each government level, however, would excercise a particular bias in assessing the costs and benefits of alternate financing arrangements. (Walton-Minnesota)

WATER RESOURCES OF THE USSR. PROBLEMS OF THEIR EFFICIENT USE AND CONSERVATION (VODNYYE RESURSY SSSR. PROBLEMY IKH EFFEKTIVNOGO ISPOL'ZOVANIYA I OKHRANY),
Ye. Ye. Alekseyevskiy.
Vodnyye Resursy, No 2, p 7-24, 1972. 2 tab.

Descriptors: *Water resources, *Water utilization, *Water conservation, Water management (Applied), Water supply, Water pollution, Water quality, Water users, Agriculture, Land reclamation, Irrigation, Drainage, Irrigation water, Freshwater, Economic efficiency, Legislation.
Identifiers: USSR.

One of the major water users in the Soviet national economy is agriculture. A major problem in agriculture is that of increasing economic efficiency of land reclamation through creation of large farms on irrigated lands and of optimally combining all factors involved in intensification of agricultural production (mechanization, introduction of chemical processes, selective breeding, etc). Basic problems in the conservation and rational use of water resources, including ways of increasing productive use of irrigation water, are discussed, and special attention is paid to major trends in scientific investigations tending to promote scientific and technical progress in the field of water management. A brief account is given of freshwater resources in the USSR and of their present and future use. (Josefson-USGS)

LOUISIANA SUPERPORT STUDIES: REPORT 1, PRELIMINARY RECOMMENDATIONS AND DATA ANALYSIS,
Louisiana State Univ., Baton Rouge. Center for Wetlands Resources.
J. H. Stone, M. J. Hershman, D. B. Johnson, S. M. Gagliano, and C. A. Whitehurst.
Publication LSU-SG-72-03, August, 1972. 419 p, 42 fig, 19 tab, 61 ref, append. $5.00. NOAA Office of Sea Grant 2-35231.

Descriptors: *Regional economics, *Superports, *Deep water ports, Supership.

United States, lacking deep draft ports that can accommodate vessels of more than 80,000 dead weight tons, is presently unable to take advantage of the economies of scale provided by the growing number of supership. The decision to develop a superport (deep water port) in Louisiana is necessarily influenced by legal, environmental, and engineering aspects as well as economic considerations. The first chapter summarizes preliminary recommendations. State control is seen as essential for ensuring appropriate plans and objectives. The remaining chapters detail such topics as the interface between local/state/federal interests in the superport; responsibilities for supportive services, including transportation/utility links; taxation questions; pertinent legal statutes, data on superships and superports; recent economic and political trends affecting superport development and utilization; petroleum and crude flows within and among Petroleum Administration Districts;

commodity flows data, both export and import, for the Central Gulf region; probable natural, cultural, and social stresses, constraints, and opportunities resulting from a superport; alternative forms of superport structure; and a model of how the superport will affect product distribution to modes of transportation and how this distribution will affect transportation modes operating long the Mississippi River. USE OF REGIONAL ECONOMIC MODELS IN THE EVALUATION OF DROUGHT IMPACT,
Colorado State Univ., Fort Collins.
J. Millan.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 534-550, 1973. 2 fig, 2 tab, 11 ref.

Descriptors: *Droughts, *Mathematical models, Economics, *Economic impact, Dynamic programming, Water shortage, Monte Carlo method, Hydrologic data, *Regional analysis.

A comprehensive model determines the total impact of drought on a region's economy. The model accounts for the direct and indirect effect of droughts in both space and time. A programming formulation of the dynamic type simulates the regional economy over a selected time horizon in order to allocate the drought shortages and compute its losses following a consistent procedure. The Monte Carlo method of generating large numbers of hydrologic samples is used with the model of the regional economy to make probabilistic statements about the different impacts of droughts. REGIONAL WATER EXCHANGE SYSTEM AS AN ALTERNATIVE FOR ALLEVIATING DROUGHT PROBLEMS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
K. Takeuchi.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 561-573, 1973. 1 fig, 3 tab, 3 ref. NSF Grant GK-11564.

Descriptors: *Water management (Applied), *Water transfer, *Droughts, Water shortage, Water supply, Reservoir design, Reservoir operation, Inter-basin transfers, *Regional analysis.

Construction of large reservoirs to alleviate drought problems is a growing source of sociopolitical, economic, and ecological problems in the affected regions, as well as in the areas to be inundated. Regional water exchange systems are proposed as an effective alternative to or as a supplement to large water regulation reservoirs. To quantify the effect of water exchange systems, the reduction ratio is introduced. Conceptualization of regional water exchange systems, theoretical introduction to the proposed indicator, and an example of application of the indicator to the six major subregions in the Central West of the United States are discussed. (Knapp-USGS)

COMPREHENSIVE AREA-WIDE WATER AND WASTEWATER FACILITIES PLAN AND PROGRAM FOR THE MID-CUMBERLAND REGION OF TENNESSEE.
Barge, Waggoner, Sumner and Cannon, Inc., Nashville, Tenn.

Prepared for Mid-Cumberland Council of Governments and Mid-Cumberland Development District, June 1973. 93 p, 4 fig, 2 tab, 3 append. CPA-TN-33-1002-3082. CPA-TN-33-1002.

Descriptors: *Water supply, *Sewerage, Coordination, Waste water disposal, *Tennessee, Costs, Water quality, Land use, Planning, Waste water treatment, *Treatment facilities, *Comprehensive planning.
Identifiers: Mid-Cumberland Region (Tenn), *Cumberland River (Tenn), Utility extension, Nashville (Tenn).

A comprehensive area-wide water and wastewater facilities plan based on previous economic, population and land use forecasts is presented. The Mid-Cumberland Region is on the threshold of a period of sustained growth. Utility needs over the next 5 to 10 and 20 to 30 years are identified and related to over all planning objectives and criteria for guiding growth and development established by the Mid-Cumberland Council of Governments and Development District. Types, locations and extent of water intake and treatment plants, storage and distribution facilities as well as wastewater treatment plants, sewers and force mains to be added or modified are discussed on a county-by-county basis. Extensive public water supply systems rely increasingly on surface streams as sources. Reduction of 68 distribution systems to 23 systems is recommended. Cumberland River and its tributaries will continue to serve as primary waste disposal sites for the region. Comparatively few wastewater systems exist. Lack of uniform construction standards has led to undersized lines and storage facilities inadequate for future needs. A program for coordinated operation and maintenance of area-wide water and wastewater systems is suggested. It is proposed that a regular department or agency of county government be responsible for planning, financing, constructing, operating and maintaining the water and wastewater facilities in each county outside municipal service areas. Legislation by the Tennessee General Assembly may be necessary. (Edwards - North Carolina)

PARTICIPATION AND EXPENDITURES FOR HUNTING, FISHING AND GENERAL RURAL OUTDOOR RECREATION IN ARIZONA,
Arizona Univ., Tucson.
R. L. Gum, W. E. Martin, A. H. Smith, and C. D. Depping.
Arizona Agricultural Experiment Station, Research Report 270. August 1973. 27 p, 11 illus, 37 tab.

Descriptors: *Hunting, *Fishing, *Recreation, *Wildlife, *Social participation, Big game, Small game, Waterflow, Attitudes, Economics, Motivation, Multiple-purpose projects, Natural resources, Psychological aspects, Recreation demand, *Arizona, Surveys, Warm-water fishing, Cold-water fishing, Economic impact, Expenditures.

A fourth survey of hunting and fishing, covering the year 1970, was conducted to determine the total economic value of benefits assignable to fish and wildlife in Arizona, and to ascertain the participation and expenditures of sportsmen, emphasizing household participation and expenditure, rather than man-trips and man-days. A study of the recreation activities of households allowed for expansion of the number of rural outdoor recreational activities which could be researched. Statistical data on types of hunting and fishing by resident and nonresident, including comparisons between 1965 expenditures and 1970 expenditures, are given. Socioeconomic characteristics and attitudes of households delineate a composite picture of sportsmen, with a majority of them being in the 35-54 year age bracket, for both resident and nonresident, with sportsmen in the older age brackets representing a larger portion of the total than they did in 1965. Educational levels, occupations, incomes, size of place of residence, percentage of household trips with more than one household participating, and attitudes about hunting and fishing of both nonresident and resident sportsmen and nonsportsmen are included. PUBLIC INVESTMENT CRITERIA FOR WATER ORIENTED RECREATION IN THE LAKE ERIE BASIN,
Ohio State Univ., Columbus. Dept. of Economics.
R. A. Tybout.
Available from the National Technical Information Service as PB-223 912, $2.75 in paper copy, $1.45 in microfiche. Ohio Water Resources Center, Columbus, Project Completion Report No. 346X, December 1972. 7 p. OWRR A-009-OHIO (1). 14-01-0001-1403.

Descriptors: *Recreation demand, *Investment, Water pollution, Economic prediction, Measurement, Water sports, Regression analysis, *Lake Erie, Resource allocation, *Water allocation (Policy), *Income analysis, Pollution taxes (Charges).
Identifiers: Negative externalities, Demand analysis, Economic criteria, *Coase theorem.

The research results of an attempt to correct several basic flaws in the economic theory relevant to pricing pollution and other negative externalities are presented. Specifically, the validity of the Cease Theorem concerning the ownership of a polluting factor and its effect on the allocation of resources is ciriticized. It is noted that property rights should not be associated with pollution factors, but rather pollution output; and the two profit concepts of total and marginal profits are reconciled for the case of internalization by compensation. Comprehensive measurement of the demand for water-based recreation is discussed. It is suggested that such a measure must relate to the quantity of recreation consumed. Three important effects which must be reflected in shift parameters were noted: long term changes in income levels, natural site quality, and congestion. A theoretical model for shift analysis within an econometric framework was developed. (Weaver-Wisconsin)

WATER PLANNING MODELS IN NORTH ATLANTIC STUDY,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
D. C. Major.
Journal of the Urban Planning and Development Division, American Society of Civil Engineers, Vol 99, No UP2, Proceedings paper No. 9996, p 131-136, September 1973. 1 fig, 9 ref.

Descriptors: *Water resources, *Comprehensive planning, *Water supply, *Mathematical models, Water demand, Water flow, Municipal water, Constraints, Regional analysis, Input-output analysis, Systems analysis, Optimization.
Identifiers: *Urban planning, *Economic analysis, Cost minimization.

Large-scale computerized water flow demand and supply models for the North Atlantic Regional Water Resources Study are described together with their use in the planning process. The demand model is a requirement projection model based on a regionalized input-output table, a regression projection equation, and water use coefficients. The supply model is a mathematical programming model that minimizes costs of supply subject to constraints. The models were used in a multiobjective planning context in which efforts were made to incorporate model results into the planning process. Use of the models in this context had positive effects on the planning process. (Bell-Cornell)

UTILITY DISTRICT ANTICIPATES FUTURE WATER NEEDS,
East Bay Municipal Utility District, Oakland, Calif.
J. S. Harnett.
Public Works, Vol 104, No 7, p 64-67, July, 1973. 2 fig, 5 photos.

Descriptors: *Water supply development, *Watershed management, Dependable supply, *Reclaimed water, Desalination process, *Water demand, *Water conservation, *California, Projections, Human population, Urbanization.
Identifiers: *American River Project (Calif), San Francisco Bay.

Conservative population projections estimate a 23% increase in the population of the East Bay (California) Municipal Utility District (EBMUD) by the year 2000. At present water supply consumption levels, this would result in a 92% increase in water use. In order to prevent future water shortages, the EBMUD adopted a Water Management Plan in October, 1972. Key to this is the American River Project, based on a contract for 134 mgd of American River water to be taken from Folsom South Canal. Public health considerations, such as nutrient content, turbidity, the presence of nuisance organisms and pollution of watershed areas, were a major factor in the choice of the American River over the Sacramento River. Although the District is convinced that the American River Project will meet future water demands, it is also implementing a realistic approach toward wastewater reclamation and reuse, desalting, weather management, watershed management, and water conservation. Difficulties associated with dependence on reclaimed water result from the high cost of processing and the poor quality of the water, which restricts its use to industrial purposes. High cost is also the primary impediment to using desalted water. (Hoffman-North Carolina)
W73-15023

PRIORITY RANKING OF FUTURE FLOOD CONTROL INVESTMENTS,
Pennsylvania Dept. of Environmental Resources, Harrisburg.
S. L. Chiang.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 230-236, 1973. 2 fig, 2 tab.

Descriptors: *Decision making, *Flood control, Flood damage, Economics, Cost-benefit analysis, *Demand, *Supply, Flood protection, Flood frequency, Investment, Water management (Applied), *Water demand.

Because of limited budgets available for flood control purposes, the priority ranking flood control investments is necessary. A ranking method is given, based on demand-supply study of a basin using historical flood damage data, flood frequency information, as well as the inventory of the existing and proposed flood control structures. Demand is defined as the annual flood damage, and supply is the annual flood control investment. The difference, D-S, and the ratio, S/D, provide decision makers with a useful tool for determining general priority of future investments. The D-S represents the future maximum potential investments; S/D indicates the degree of investment to date. Therefore, the watershed with high D-S and low S/D should have high priority for future protection. The product of (D-S) and (1 - S/D), which takes into account both factors influencing the priority, may be used to rank the priority objectively. Thus the formula, (D/S) X (1 - S/D), may be called the priority ranking function. (Knapp-USGS)

MARITIME PROVINCES WATER RESOURCES STUDY, STAGE 1, VOL 1, SUMMARY.
Montreal Engineering Co. Ltd. (Quebec).

Prepared for Atlantic Development Board, Ottawa, Canada, January 1969. 87 p, 6 fig, 6 tab, append.

Descriptors: *Water supply, *Water demand, *Environmental effects, *Canada, Facilities, *Distribution systems, Financing, Costs, Water quality, Pollutants, Water requirements, Data collections, Capital costs.
Identifiers: *Utility extension, Water resources study, *Maritime Provinces (Canada).

A two year study of the quantity and quality of water resources in the Canadian Maritime Provinces is summarized. Present and future demands are assessed; areas with existing or impending problems, conflicts or opportunities are identified. Discussed are: current demand inventories and forecast of demands to 1981, with future indications; a study of water utilization characteristics of major water-using industries relevant to the Maritime Provinces; studies of hydrometeorology and hydrogeology to determine quantity and quality of surface and ground-water supplies; study of the adequacy of data collection networks plus identification of necessary improvements; inventory of existing water supply facilities and development possibilities; commentaries on recent developments and techniques for improving water quantity and quality; and analysis of demand and supply to identify areas with substantial possibilities or significant problems; and a preliminary ranking of areas for future detailed planning studies. Some conclusions are: (1) Maritime Provinces are abundantly endowed with surface and ground water although some isolated areas have water shortages. Development costs will be high; (2) Pollution is an important recurring problem. Large investments will be required, in the order of $251 million in capital expenditures for the region; (3) More urban water utilities will need to undertake major expansions in the next 10 to 15 years involving expenditures of at least $60 million; (4) fire protection, water quality and operating deficiencies are common; (5) greater involvement by provincial governments is necessary. (Edwards - North Carolina)

A SURVEY OF LONG-TERM WATER REQUIREMENTS IN JAPAN.
Economic Commission for Asia and the Far East (UN), New York.

Water Resources Journal, United Nations Economic Commission for Asia and the Far East (ECAFE), p 18-28, December 1972. 7 fig, 7 tab.

Descriptors: *Water resources development, *Water demand, *Inter-basin transfers, Reservoir design, Irrigation water, Water supply, Hydroelectric power, Water transfer, Flood control, Water pollution control, Planning.
Identifiers: *Japan.

Although Japan has more precipitation than many other countries, the seasonal variation of precipitation is large and streamflow fluctuates considerably. Moreover, due to topographical conditions, there are few sites suitable for the construction of large reservoirs. This makes the efficient utilization of water resources difficult. The total annual runoff of the rivers in Japan is approximately 520,000 million cu. m. If all the flows in the headwaters were totally controlled by upstream dams, the maximum utilization rate of runoff would be about 40%. Utilization of the midstream and downstream flows will be necessary. The construction of at least 760 dams and other facilities will be required. Inter-basin transfers of river flows require construction of some 480 dams and other facilities. It is essential that effective measures be taken to economize the use of agricultural water, to recycle the use of drainage water and to improve the recovery rate of used water. More intensive utilization of flows as envisaged will caused the extensive pollution of the rivers, which is likely to pose a serious problem. (Knapp-USGS)

Identifiers: *USSR.

The problem of water is examined from social, scientific, and technical points of view, and achievements in hydrology are linked to the organization of international cooperation in this field. The program of the International Hydrological Decade (IHD) and its objectives in studying water resources, expanding scientific investigations, training and educating hydrologists, and facilitating information exchange are discussed. The most important objectives of IHD are: establishment of an international network of hydrologic stations; determination of effects of natural factors and human activity on hydrologic processes; and problems of the water balance. The important contribution of Soviet scientists to development of theoretical and practical aspects of problems undertaken by IHD is noted. (Josefson-USGS)

COASTAL ZONE MANAGEMENT ACT: A BROADER SCOPE FOR STATE INITIATIVE,
National Oceanic and Atmospheric Administration, Rockville, Md. Office of Coastal Zone Management.
R. Knecht.
Water Spectrum, Vol 5, No 1, p 32-36, 1973. 3 photo.

Descriptors: *Coasts, *Coastal areas, Beaches, Water resources, Land use, Land management, Land classification.
Identifiers: Coastal Zone Management Act.

The needs for clean air, clean water, clean beaches, good fishing, multiple use of natural resources and the increasing ability of Americans to buy a waterfront or beach front lot to escape the problems of environment degeneration has caused tremendous growth in efforts directed at coastal zone management and protection. The approaches taken by different states to regulate their coastal zones are described. States are compared on the basis of their recent legislative efforts, their general effectiveness and the long range planning involved. Federal action and legislation is discussed as it is administered by the National Oceanic and Atmospheric Administration. (Wadley-Florida)

MEANDERING RIGHTS FOR CONTRACTED WATER,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Water Resources Research Center.
W. Walker, and W. Cox.
Water Spectrum, Vol 5, No 1, p 37-41, 1973. 3 map, 7 photo.

Descriptors: *Legal aspects, *Water law, *Water rights, *Riparian rights, *Prior appropriation, *Reservoirs, Domestic water, Discharge (Water), Water sources, Streams, Natural streams.

Federal reservoirs and contracts with municipalities for the waters in such reservoirs may be lulling the municipalities into a false sense of security with respect to future water shortages. Problems such as sending the water from the reservoir to the city down natural stream channels or the burden placed on the municipality by the enabling legislation to acquire valid water rights in the water often will put the municipality in direct conflict with pre-existing private rights in the same water. Problems associated with federal involvement in the supply picture, general water law concepts and rights derived therefrom, and acquisition and storage rights to the water are discussed. It is recommended that states reevaluate the protection afforded the municipality when water is conveyed by way of natural stream channels and the amount of state control retained over the uses made of the water. Some thought as well should be given to industrial and municipal uses obtaining storage rights in private hydroelectric projects. Other recommendations are included. (Wadley-Florida)
W73-15143

PROHIBITIONS AGAINST WATER POLLUTION.
N.Y. Sess. Laws, Ch. 664, Secs. 17-0501 through 17-1107 (McKinney 1973).

Descriptors: *New York, *Permits, *Penalties (Legal), *Water pollution, Sewage effluents, Water pollution control, Statutes, Legislation.

This statute, consisting of titles 5, 7, 9 and 11 of Chapter 664 of the New York Session Laws, 1973 deals with water pollution. Under this statute, it is unlawful for any person, directly or indirectly, to throw, drain, run or otherwise discharge into the waters involved any organic or inorganic matter that shall cause or contribute to a condition that contravenes the standards adopted by the department authorized by statute. The statute also includes prohibitions of pollution of waters of the marine district, permit requirements, prohibitions against modification of wastes discharged through existing outlets without the requisite permits, minimum treatment required, restrictions on discharge of sewage, industrial waste or other wastes, and procedure for notice, hearings and court reviews. (Wadley-Florida)
W73-15144

STATE V. GENERAL MOTORS CORPORATION (PROSECUTION OF CORPORATION FOR VIOLATION OF STATE STATUTE PROSCRIBING POLLUTION OF STATE WATER).
296 N.E.2d 317-320 (Mun Ct. of Newton Falls, Ohio, 1973). 4 p.

Descriptors: *Legal aspects, *Judicial decisions, *Water pollution sources, *Water pollution control, Environmental effects.

Defendant corporation prosecuted for failure to comply with state statute proscribing polluting state land and water. The court held that the elements of the offense had not been proved by the state and defendant was discharged. The company was charged with placing matter of an unsightly or unsanitary nature into a ditch or watercourse whose waters combine or effect a junction with natural surface or underground water. Three to five hundred gallons of the offending substance were accidentally discharged into the drainage system of the corporation and were trapped in a dam temporarily placed on private property for purposes of trapping and treating the affected waters. The state failed to show that the untreated waters ever combined or affected a junction with natural stream waters. Further, as the discharge was accidental, based on ignorance of fact, a valid defense was offered by the corporation. (Wadley-Florida)
W73-15145

ENVIRONMENTAL DEFENSE FUND, INC. V. ARMSTRONG (ACTION BY ENVIRONMENTAL PROTECTION GROUPS AGAINST COMMISSIONER OF BUREAU OF RECLAMATION AND OTHERS FOR INJUNCTIVE RELIEF WITH RESPECT TO THE PROPOSED NEW MELONES DAM) .
356 F. Supp. 131-140 (ND. Calif. 1973). 10 p.

Descriptors: *Legal aspects, *Environmental effects, *California, *Dams, Engineering structures, Diversion structures, Water supply, Reservoir yield.
Identifiers: Environmental impact statement (Construction), Environmental impact statement (Adequacy).

An environmental impact statement was prepared by the United States Corps of Army Engineers for a proposed dam project. The statement was challenged by environmental protection groups as being insufficient to comply with standards required by the National Environmental Policy Act of 1969 (NEPA). The court held that while the statement needed supplementation, it complied with the requirements of NEPA. All reasonable alternatives to the project had been considered and in its supplemental form the statement added the necessary detail required. The objection of the environmental groups focusing primarily on the lack of detail regarding use priorities, water supply situations and alternative supply sources are discussed by the court and rejected. The court, nevertheless, retained jurisdiction over the matter to insure full compliance with its order in the form of a further statement or at least additional data on the operation of the project prior to the actual use of any of the conservation yield of the dam. (Wadley-Florida)
W73-15146

STREAM CHANNELIZATION (A CRITIQUE OF CEQ'S CHANNELIZATION REPORT),
Arkansas Wildlife Federation, Little Rock.
K. Hampton.
Arkansas Out-of-Doors, Vol 2, No 6, p 2, June 1973.

Descriptors: *Stream improvement, *Channel improvement, *Environmental effects, *Erosion, Streamflow, Streams, Stream erosion, Stream stabilization, Channel erosion, Ecology, Erosion control, Wetlands, Drainage, Habitat, Water table, Water levels, Downstream aesthetics, Natural resources, Water resources, Land resources, Wildlife.
Identifiers: *Stream channelization.

Following the publication of the final report on stream channel modification prepared for the President's Council on Environmental Quality, this article reports the mixed conclusions concerning the effects of stream channelization on the physical environment. Of 42 projects studied, 11 had a pronounced significance to wetland drainage and land use changes. A dramatic loss of hardwoods in the Mississippi Delta has resulted from five of the projects. Water table level and stream recharge capability were adversely affected. Some of the projects studied showed low actual or potential contribution to the natural erosion and sediment problem; others were classified as 'uncertain' and a few had a clear adverse effect. Some projects induced clearly adverse downstream effects. Somewhat less than half the projects caused considerable localized adverse change in the appearance of the environment. It is suggested that there is a strong correlation between channel project dimension and intensity of physical effects. Other findings were made relative to channeling effects on fish and wildlife resources, habitat, productivity and species diversity. (Reed-Florida)

THE FEDERAL COASTAL ZONE MANAGEMENT ACT OF 1972,
Louisiana State Univ., Baton Rouge. Office of Sea Grant Development.
M. Hershman.
Available from the National Technical Information Service as COM-73 10313. Louisiana Coastal Law, Report No 8, p 1-6, December 1972.

Descriptors: *Legislation, *Coasts, *Grants, *Federal government, Administrative agencies, Coastal engineering, Coastal structures, Coastal plains, Coastal marshes, Projects, Water law, Management, Administration, Legal aspects, Permits, Planning, Governmental interrelations.
Identifiers: *Coastal Zone Management Act of 1972, Coastal zone management.

In this description and interpretation of the Coastal Zone Management Act of 1972 (Act), the historical factors that resulted in the Act are discussed. Under the Act, state governments are the focal point for coastal zone management. Grants to assist the state in developing a management program are followed by grants to assist the state in administering their programs. Only those coastal lands which have a direct and significant impact on coastal waters may be regulated under the Act. The legislation does not require state participation, but does offer a financial incentive for such participation. Under the interagency coordination and cooperation provisions, the views of affected agencies must have been considered by the State prior to the Secretary of Commerce's approval of the management program. Once approved, federal agency activities must be consistent with the coastal management programs of that state, to the maximum extent practicable. Specific state legislation will be necessary to comply with the Act. Under the Act, a state could emphasize preservation or development. The Act should be flexible enough to accommodate and enhance state efforts that have preceded it. For purposes of requesting federal grants, distinction will have to be made between coastal and land use management. (Reed-Florida)
W73-15148

A BILL TO ESTABLISH THE BIG THICKET NATIONAL PARK IN TEXAS.

Senate Bill 314, 93rd Cong, 1st Sess (1973). 3 p.

Descriptors: *Texas, *Streams, Natural streams, Land use, Land management.
Identifiers: *Big Thicket National Park (Tex).

This bill proposes the establishment of the Big Thicket National Park (Park) in Texas. The purpose of the legislation is to preserve the outstanding botanical, zoological, geological, archeological and ecological values of the area, together with the recreational, historical, scenic and natural values of the area as a wildlife habitat and recreational area. The bill provides for the acquisition of the necessary land for the park and for administration of the park once it is established. Bill emphasizes preservation of free-flowing streams in area to be covered by park. (Wadley-Florida)
W73-15149

A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT BY ESTABLISHING STANDARDS FOR SYNTHETIC DETERGENTS.

House Bill 3107, 93rd Cong, 1st Sess (1973). 14 p.

Descriptors: *United States, *Detergents, *Federal Water Pollution Control Act, *Legislation, *Phosphates, Public health, Phosphorus, Chemical water, Water pollution sources, Eutrophication, Water quality, Biodegradation, Legal aspects, Penalties (Legal).

This bill would amend the Federal Water Pollution Control Act so as to establish standards which must be met by all synthetic detergents and to ban from detergents all phosphates and those synthetics which fail to meet the standards by a specified date. Standards of water eutrophication ability, biodegradability, toxicity and effects on the public health and welfare will be established which must be met by all synthetic detergents. The proposed bill details the basis upon which the standards are to be designed. A willful violation of these provisions of the proposed Act is to be considered a misdemeanor punishable by a fine. An inventory and report on existing technology or substitutes for polyphosphates in detergents will be made. The Interior Department will assist in the research and development of formulations which will eliminate pollutants from detergents. After a specified date, it will be unlawful for any person to import or manufacture any detergent formulation containing phosphorus not in compliance with the proposed standards. (Reed-Florida)
W73-15150

A BILL TO AUTHORIZE THE ESTABLISHMENT OF THE FLORIDA FRONTIER HISTORIC RIVERWAY.
House Bill 64, 93d Cong, 1st Sess (January 3, 1973). 4 p.

Descriptors: *Florida, *Estuaries, Legal aspect.
Identifiers: *Nassau River, Florida Frontier Historic Riverway, Estuarine protection, Land acquisition.

The bill proposes the establishment of the Florida Historic Riverway (riverway) and provides for the acquistion and mangement of the various components of the riverway. The riverway involves primarily the Nassau River estuary but will include some lands other than estuarine marshes and streambeds. The lands will be acquired by the Department of the Interior (Department) by donation, purchase or exchange and once sufficient lands are available to insure the realization of the purposes of the act, the Secretary of the Department will establish the riverway by appropriate publication in the Federal Register. Also included will be the Castillo de San Marcos National Monument, the Fort Mantanzas National Monument, and the Fort Caroline National Memorial. (Wadley-Florida)
W73-15151

FLORIDA COURTS AND WATER POLLUTION: A FLOATING CRAP GAME,
L. Fischer.
Environmental Law, Vol 2, No 1, p 189-195, Winter 1971. 28 ref.

Descriptors: *Florida, *Sewage treatment, *Sewage disposal, *Outfall sewers, Condemnation, Easements.
Identifiers: Ocean outfall disposal.

The town of Palm Beach, Florida sought to resist an attempt of the city of West Palm Beach to condemn a strip of land for use as a sewage disposal system utilizing an ocean outfall. Palm Beach argued that while the sewage system proposed was admittedly a public purpose, it was against the public policy of the state due to the low level of treatment required. The court decided in favor of West Palm Beach. The decision and the implications thereof are analyzed citing analogous Florida cases and relevant provisions of the rules of the Department of Air and Water Pollution Control, the Federal Water Pollution Control Act and the Water Quality Improvement Act of 1970. (Wadley-Florida)

WALTON V. ST. CLAIR: THE STANDING QUESTION,
Popham, Haik, Schnobrich, Kaufman and Doty Ltd., Minneapolis, Minn.
F. S. Richards.
Natural Resources Law, Vol 4, No 1, p 47-59, January 1971. 47 ref.

Descriptors: *Minnesota, Legal aspects, Environmental control, Rivers.
Identifiers: Standing to sue, Prevention of mineral exploration, Boundary Waters Canoe Area.

The Izaak Walton League (League) of America sought to prevent mineral exploration in the Boundary Waters Canoe Area of northeastern Minnesota. In addition to the substantive issues of the extent of mineral interests in the area and to what degree governmental officials have implemented legislative and executive laws, rules and regulations pertinent to the area, the question of standing to sue was fundamental to the prosecution of the League's claims. The League asserted that as a private party it had standing to assert its claims for declaratory judgment in the federal court and the court allowed the League to maintain the action over the objection of the defendant parties. The history of the standing to sue controversy in recent years is discussed detailing the modifications of the rule. Even with the extensive erosion caused by recent cases, a plaintiff must still show where he has a personal stake or some special interest in seeking judicial relief even though such interest need not be purely economic. The interest of the League in this particular case is discussed. The court properly held the League had standing to sue. (Wadley-Florida)

TAKING VERSUS REASONABLE REGULATION: A REAPPRAISAL IN LIGHT OF REGIONAL PLANNING AND WETLANDS,
D. Binder.
University of Florida Law Review, Vol 25, No 1, p 1-43, Fall 1972. 48 p, 344 ref.

Descriptors: *Wetlands, *Legal aspects, *Water resources development, *Regulation, Marshes, Eminent domain, Constitutional law, Aquatic environment, Land reclamation, Wildlife conservation, Coastal marshes, Tidal marshes, Water utilization, Water Management (Applied), Water zoning, Administration, Regional development.

A comprehensive analysis is presented of the constitutional dilemma involved in the taking of private property for public use as opposed to reasonable regulation in light of current activities involving regional planning and wetlands. The important distinctions between the police power and eminent domain are described and the status of the law today is discussed. The proper test to be employed must balance various rights. These legal doctrines, as well as the legislative response, are then discussed with reference to wetlands. Wetlands conservation presents the taking-regulation problem in its most acute form. Although the value of wetlands to the public is paramount, the necessary restrictions may make the land almost unusable, while the cost of acquisition by eminent domain is prohibitive. Regional planning is the best means of equitably distributing the burdens occasioned by wetlands preservation. Although a diminution in value will ordinarily result to the wetlands owners involved, this will partially be offset by a corresponding decrease in property taxes. (Mockler-Florida)

LERRO V. THOMAS WYNNE, INC. (ACTION BY PROPERTY OWNERS THROUGH WHOSE PROPERTY CREEK FLOWED AND WHO WERE AFFECTED BY PRESENCE OF FUEL OIL IN THE CREEK).
301 A.2d 705-708 (Pa. 1973).

Descriptors: *Pennsylvania, *Judicial decisions, *Underground storage, *Oil pollution, Oil wastes, Storage tanks, Water quality control, Oily water, Water pollution sources, Negligence, Legal aspects, Fuels, Corrosion.

An equity action by plaintiffs--nearby residents and property owners against a corporate defendant that owned and operated apartment houses is discussed. Between 1963 and 1968 large quantities of fuel oil leaked from a corroded 10,000 gallon tank buried in the ground on defendant's property. As a result of corrosion, holes developed in the tank, and the fuel oil seeped into the ground and flowed underground through adjoining properties into a creek which flowed through plaintiffs' property. Petroleum odors emanated from the creek, and the fuel oil caused a discoloration of the sides of the raceway of the creek, a discoloration of the water, and adhered to the clothing and shoes of children playing in the creek, resulting in a tracking of oil into homes. The flow of the seeping oil into the stream created a definite, visible, and noticeable problem. The court held that the corporate owner and operator of the apartment house was negligent in that it should have known of the risk of corrosion to a 10,000 gallon tank buried in the ground and supplying fuel oil for heating the apartment house and should have provided for periodic inspections which were inexpensive and simple. (Mockler-Florida)

CONSERVATIONIST'S STANDING TO CHALLENGE THE ACTIONS OF FEDERAL AGENCIES,
M. Hardin
Ecology Law Quarterly, Vol 1, No 2, p 305-329, Spring 1971. 24 p, 105 ref

Descriptors: *Legal aspects, *Judicial decisions, *Water conservation, Conservation, Legal review, Administration, Administrative agencies, Natural resources, Legislation, Federal government, Court decisions, Law enforcement, Water law, Penalties (Legal), Environment, Social aspects, Ecology, Environmental effects
Identifiers: *Standing (Legal), Private actions (Legal).

While the federal government has long possessed broad regulatory powers to preserve natural resources, administrative bottlenecks have prevented effective implementation and enforcement of available legislation. It is left to private actions, therefore, to compel the needed enforcement and halt environmental damage. The courts must be accessible to the qualified conservationist if private suits are to be an effective means of enforcing existing law. The liberality of the doctrine of standing to sue is important in this context. New tests for standing should prove useful to conservationists attempting private actions. There are three general requirements of standing: (1) there must be a case or controversy, (2) the interest sought to be protected by the complainant must be within the zone of interests protected by the statute or constitutional guarantee in question, and (3) the statute whose guarantees are being invoked must not positively deny standing to the plaintiffs bringing the action. The main thrust of the holdings in two recent cases discussed was to reduce substantially the threshhold requirements of standing. (Glickman-Florida)
W73-15158

TOWN OF SALEM V. COUNTY OF KENOSHA (SUIT TO DETERMINE CONSTITUTIONALITY OF SHORELANDS AND FLOODLANDS ORDINANCE).

204 N.W.2d 467-469 (Wis. 1973).

Descriptors: *Wisconsin, *Legal aspects, *Zoning, Flood plain zoning, Land use, Shore protection.
Identifiers: Sanitation ordinance.

The town of Salem sued to test the constitutionality of an ordinance passed by the County of Kenosha dealing with floodlands and shorelands zoning. While the court held that the town had standing to bring the suit it had not proerly pleaded a cause of action for which the relief could be granted. The particular ordinance was argued to be a sanitary ordinance rather than a zoning ordinance by the town and it was further argued that such an ordinance was not applicable to the town as it already had a similar ordinance of its own. The complaint, however, failed to include an allegation that the county ordinance in question was a sanitary ordinance or that it was passed under any particular statutory sections and as such did not state a cause of action. (Wadley-Florida)

GIBBS V. WRIGHT (ACTION TO DETERMINE RIGHT TO OBTAIN WATER FROM SPRING),

195 S.E.2d 40-44 (Ct. App. N.C. 1973).

Descriptors: *North Carolina, *Judicial decisions, *Easements, *Springs, Adjacent landowners, Legal aspects, Water law, Boundaries (Property), Freshwater, Spring waters, Surface waters, Water rights, Prescriptive rights, Water policy, Reasonable use, Domestic water, Consumptive use, Water utilization.

Plaintiffs, owners of property upon which a spring was located, sought a declaratory judgment against defendants, owners of adjacent property, to determine defendants' right to obtain water from the spring. Plaintiffs' predecessor in title orally agreed to allow defendants' predecessor in title to run a pipe from the stream to his house, provided that he limit himself to reasonable use. The trial court held that a duly recorded easement had been granted. On appeal, plaintiff contended that the right granted to obtain water from the spring was not an easement appurtenant to the land, but a personal license limited to the original grantee. The appellate court upheld the decision of the lower court, stating that whether an easement was appurtenant or in gross depended on the intent of the parties creating it. Where it may be so construed, the law favors appurtenant easements which was found to be the nature of the easement in this case. The original judgment was modified to make clear that defendants' rights are nonexclusive of plaintiffs' continuing rights also to make reasonable use of the spring. (Mockler-Florida)
W73-15160

DRINKWINE V. STATE OF VERMONT (SUIT TO RESTRAIN STATE FROM OPERATION OF PUMPS AND DRILLED WELLS LOCATED ON ITS PROPERTY).
300 A.2d 616-618 (Vt. 1973).

Descriptors: *Vermont, *Groundwater, Legal aspects, *Water rights, *Water wells, Pumping.

Suit was brought to restrain the state from pumping from wells located on the state property. Plaintiff argued that such pumping was unreasonable in that it lowered the water table in and around plaintiff's land and dried up his springs. The court held that the law of the jurisdiction was well settled that the owner of land was absolute owner of the groundwater under the land and that since the state did not apply the reasonable use doctrine to groundwater, the injunction would not lie against the state. The only remedy available to plaintiffs would be for damages, if any. (Wadley-Florida)
W73-15161

DEEP WATER PORT POLICY ISSUES.
Hearing--Comm. on Interior and Insular Affairs--United States Senate, 92d Cong, 2d Sess, April 25, 1972. 687 p, 11 fig, 2 plate, 2 map, 19 tab, 7 chart, 4 append.

Descriptors: *Federal government, *Legislation, *Harbors, *Deep water, Coastal engineering, Transportation, Legal aspects, Fuels, Bodies of water, Resources development, Port authorities, Navigation, Transportation, Water resources development, Project planning.
Identifiers: *Deep water ports.

The minutes are presented of Senate hearings on current federal programs and plans for the formulation of a national policy for deep water port development in the U.S. The open hearing was part of the Committee's National Fuels and Energy Policy Study being conducted under the authority of Senate Resolution 45. From the hearings the committee hoped to ascertain the current policies of federal agencies toward deep water port development; and what the elements of an overall national policy ought to be. Particular attention was devoted to what role the federal government should play in the selection and development of deep water facilities and whether it should take on new responsibilities for centralized planning and policy development. The testimony indicates that the future energy needs of the U.S. necessitate that Congress and the Executive Branch give careful consideration to the implications of deep water ports with regard to the many national concerns including security of our fuel supplies, total energy costs, U.S. balance of payments, and maritime regulations. The testimony of government officials, pertinent technical documents, and correspondence from interested parties are included. (McKnight-Florida)

REPORT ON THE WATER LEVELS OF THE GREAT LAKES.

Hearing--Subcomm. on Water Resources--Comm. on Public Works, U.S. House of Representatives, 93rd Cong. 1st Sess, April 1973. 84 p, 3 tab.

Descriptors: *Water levels, *Water distribution, Illinois, Water policy, Water sources, Regulation, Planning, *Great Lakes, *Lake Michigan, Legal aspects.

Testimony was taken and material received for the record concerning problems of water levels on the Great Lakes. Problems of erosion due to a rise in the level of the lakes is discussed and increased diversion of water from Lake Michigan is proposed. A legislative proposal for assistance of an emergency nature to repair threatened or destroyed structures and to provide for emergency erosion control is included. Much of the rise in lake levels is attributable to increases in precipitation and appropriate tables detailing these increases are included. Also discussed are problems to be expected by increasing discharges into waterways such as the Mississippi River. (Wadley-Florida)

THE GREAT LAKES BASIN: ALTERNATIVE INSTITUTIONAL ARRANGEMENTS FOR MULTI-PURPOSE RESOURCES MANAGEMENT,
Guelph Univ. (Ontario). Centre for Resources Development.
N. Pearson.
Background Paper for Canada-United States University Seminar on Institutional Arrangements for the Integrated Management of Water and Land Resources of the Eastern Great Lakes - 1971-1972. Centre for Resources Development, University of Guelph, Ontario. Publication No 55, February 1972. 27 p.

Descriptors: *Water management (Applied), *Administration, Coordination, *Great Lakes Basin, *Institutional constraints, Political aspects, Planning, Canada, United States, Management, *Multiple-purpose projects.
Identifiers: *United States-Canadian Boundary Waters Treaty, Administrative conflicts.

Four primary reasons for changing present institutional arrangements for management of the Great Lakes Basin are identified: contraventions of the 1909 treaty, reported in 1918, still exist; procedures for problem identification, solution, implementation, and enforcement are at best cumbersome; the integration of water, land, and air within environmental entities such as natural drainage basins, must be recognized and planned for as a whole (rather than dealing only with water pollution, as is done today); rapid environmental degradation from urbanization, industrialization, and increased recreational demands has accelerated to a point of non-control by present guidance and control mechanisms. Alternative concepts of institutional relationships, varying from an informal working arrangement to a police force and a regional government, are critically examined. Different classes of institutional arrangements, ranging from a simple Inter-State-Provincial Concept to the much more complex Supra-National Authority, are analyzed in terms of feasibility and necessary authorization. None of the mentioned structures has the required capacity for multi-purpose resources management. Rather the functional approach of seeking to identify the key objectives, derived functions, objective criteria, and specific tasks should be used to design a new kind of institution. 6G. Ecologic Impact of Water Development

IMPACTS OF WATER-RESOURCE DEVELOPMENT IN THE SNAKE RIVER AREA ON WILDLIFE,
Washington State Univ., Pullman. Dept. of Zoology.
I. O. Buss, and W. H. Funk.
Available from the National Technical Information Service as PB-223 911, $3.00 in paper copy, $1.45 in microfiche. Washington Water Research Center, Pullman, Project Completion Report, July 1973. 43 p. OWRR A-054-WASH (2).

Descriptors: Ecology, Dams, Geese (Wild), Ducks (Wild), *Waterfowl, *Washington, Management, Wildlife, *Snake River, Environmental effects, Animal populations, *Wildlife, Habitats, *Pre-impoundment, Rodents, Reservoir sites.
Identifiers: *Game animals.

Four approaches were used to study the ecologic impact of drawdown and storage of water behind dams for flood control and power on wildlife population changes in the Snake River canyon, southeast Washington. The first approach involved availability of aquatic macroinvertebrates as a potential food source for waterfowl. Data gathered at five collecting stations, from freeflowing to impounded water, showed a conspicuous transition from one benthic invertebrate community to the other as a result of decreasing current velocity and increased sedimentation. The second

approach was to record changes in relative numbers and distribution of vertebrate animals as a result of flooding riparian habitat. Number of vertebrates observed per transect mile for 21 transects showed that in all seasons studied to date, between 42 and 54 percent of all sightings occurred in river bank and floodplain vegetation, all of which will be destroyed by impoundment by Lower Granite Dam. The third approach involved seasonal trapping of small mammals along the 21 transects. Of three species of mice accounted for to date, Peromyscus maniculatus was by far the most common mammal caught (214 of 224 or 96%). In both winter and spring studies 50-75 percent of the mammals were trapped below prospective pool level in riparian habitat. The fourth approach involved information on hunter-killed game animals collected in the Snake River study area during fall hunting seasons to supplement data obtained by counting animals on the 21 transects. A total of 821 hunters (375 parties) spent 3,801 hours (about 4.6 hours hunting per man) and shot 525 game animals (7.24 man hours per animal), resulting in about 40 percent of the hunting parties being successful. These data provide year-to-year index figures that indicate population trends which will be valuable in appraising the impact of riparian habitat destruction on wildlife.

SAMPLING BIAS OF A LONGHURST-HARDY PLANKTON RECORDER,
Scripps Institution of Oceanography, La Jolla, Calif.
L. R. Haury.
Limnology and Oceanography, Vol 18, No 3, p 500-506, May 1973. 3 fig, 1 tab, 14 ref.

Descriptors: *Sampling, *Zooplankton, Mechanical equipment, Aquatic populations, Estimating.
Identifiers: *Bias, *Longhurst-Hardy plankton recorder, Recorders, Accuracy.

The sampling bias due to the residence time of organisms within the net of a vertically towed Longhurst-Hardy plankton recorder was investigated by injecting plastic pellets and preserved zooplankton into the net mouth at known times during tows. The shortest residence time was 13 sec for tow speeds of from 86 to 103 cm per sec; most plankters remained in the net much longer. The injected plankton stalled within the net intermittently, causing artificial fluctuations in abundance along the recorder gauze. Differences in tow speed caused changes in stalling characteristics. Underestimates of total plankton abundance occurred, probably due to leakage through the recorder and to permanent hangups on the net. (Little-Battelle)

T. L. Hopkins, R. C. Baird, and D. M. Milliken.
Limnology and Oceanography, Vol 18, No 3, p 488-490, May 1973. 1 fig, 3 ref.

Descriptors: *Sampling, *Design, Mechanical equipment, Trawling, Plankton.
Identifiers: *Tucker trawl.

A closing system has been developed for a Tucker trawl which offers an inexpensive, reliable alternative to the more costly and complicated acoustic and clock-timer equipment previously used. The Tucker trawl is a modification of the trawl described by Davies and Barham (1969), but uses a messenger-actuated mechanism. Knotted or knotless nylon netting is used on the trawl to which a 0.5-m plankton net is attached. The catch bucket is a 50-cm section of thick-walled PVC tubing closed at one end with a stock pipe-end fused to the tubing. Holes 12 mm in diameter are drilled in the end to facilitate movement of organisms into the bucket. The bucket is fitted with 333-micron mesh to retain the catch. The trawl is also fitted with a flowmeter which records only when the net is fishing. Trawls with release mechanism, flowmeter, and time-depth recorder cost about 1500 dollars each. (Little-Battelle)

A NOTE ON THE GENERATION OF GAMMA RANDOM VARIABLES WITH NON-INTEGRAL SHAPE PARAMETER,
Birmingham Univ. (England).
J. Whittaker.
In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 591-594, 1973. 5 ref.

Descriptors: *Statistics, *Variability, *Simulation analysis, *Synthetic hydrology, Probability, Stochastic processes, Statistical models.
Identifiers: *Gamma distributions.

A method is given for generating a variable, using random numbers, to obtain the gamma distribution (Pearson Type III) with nonintegral shape parameter. Ordinarily this method requires the generation of less than four uniform random variables. (Knapp-USGS)

In: Floods and Droughts; Proceedings of 2nd International Symposium in Hydrology, September 11-13, 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 648-664, 1973. 12 fig, 1 tab, 1 ref.

Descriptors: *Hydrologic data, *Statistics, *Probability, Statistical methods, *Distribution patterns, Variability, Data collections, Frequency analysis, Depth-area-duration analysis, Time series analysis.
Identifiers: Gamma distributions.

Hydrologic variates frequently show skew distributions, such as Gamma-type distributions. Some theories on Gamma-type distribution and runs are reviewed. The approximate distribution function of the sum of multivariates can be applied to the sequences of correlated variates and even to the case with a discontinuity (no precipitation in precipitation time sequences). The solutions are illustrated in an analysis of the relation between time unit and the probability density function of observed hydrologic data; the solutions are shown to have sufficient accuracy in practice. THE BATH STORY - NEW KENNEBEC RIVER SUBAQUEOUS WATER MAIN,
Fay, Spofford, and Thorndike, Inc., Boston, Mass.
C. S. Mansfield.
Journal of the New England Water Works Association, Vol 87, No 1, p 8-18, March, 1973. 2 photos.

Descriptors: *Closed conduits, *Maine, River regulation, Rivers, River flow, Water supply, Costs.
Identifiers: *Subaqueous conduits, *Water system expansion, Subaqueous pipe laying, Bath (Maine), *Kennebec River (Maine).

Two engineering phases led to the installation of a subaqueous water main crossing of the Kennebec River at Bath, Maine. The first phase consisted of preliminary design under which construction requirements and pipe routes were established. The pile bents of the original main were first examined to see if there was enough space available on the bents for the installation of a second main. Although the availability of space was established, possible danger to the original main during the installation of the new one necessitated choosing an alternative location. Cost considerations determined the final selection of a downstream route using ductile iron river pipe to be installed on the river bottom. The second phase involved the final design, permits, licenses, and approvals. To pinpoint the best route, a 100 foot wide band across the river was investigated, and a natural scale profile developed along a straight line at the apparent best location. This information was incorporated into a licensed plan that was filed with the Maine Environmental Improvement Commision and the Department of the Army, Corps of Engineers. Approval was obtained, the Trustees authorized purchase of pipe line and the contract was awarded. Construction proceeded rapidly, with the finished unit cost of the watermain $74 per foot. CONSTRUCTION OF MOORING FACILITIES, OHIO RIVER NAVIGATION SYSTEM (FINAL ENVIRONMENTAL STATEMENT).
Ohio River Div. Labs., Mariemont.

December 1972. 11 p, append.

Descriptors: *Ohio River, Fishing, Land use, Economics, Navigation.
Identifiers: *Mooring facilities, *Environmental Impact Statements.

The project concerns construction and maintenance of mooring facilities at various sites in the waters of the Ohio River and its navigable tributaries. The proposed action would have no known adverse economic or social impact but would reduce use of trees along the bank for mooring purposes with a consequent damage to or loss of such trees. The project would reduce erosion of the bank by allowing for instream mooring. The project would reduce, by a minor amount, the surface of the rivers currently available for fishing and some loss of river bed which now supports aquatic life. The alternative to this project is no action. Comments were received by interested officials and persons. (Wadley-Florida)

TARBELA DAM PROJECT, PAKISTAN,
Tippetts-Abbett-McCarthy-Stratton, New York.
W. V. Binger.
Journal of the Power Division, American Society of Civil Engineers, Vol 98, No PO2, p 221-245, October, 1972. 12 fig, 1 tab, 2 ref.

Descriptors: *Damsites, *Sediment control, *Water storage, *River basins, *Hydroelectric power, Dam construction, Dam design, Engineering geology, Irrigation water, Planning, Water utilization, River flow, Optimum development plans, Political aspects, Flood control.
Identifiers: *Pakistan (Tarbela Dam Project), *Indus River.

This dam complex, situated on the Indus River, will provide irrigation storage and hydroelectric power as well as measure of flood control when completed. The annual sediment load of the Indus River is 440,000,000 tons, which gives ample evidence of its erosional power. Principal sources of water for this basin come from snow melt from the Himalayas, and monsoons with seasonal peak flow in midsummer. Constructional considerations, because of the river's steep gradient--8 ft. per mile, with high flow velocities--and geographical and political situations made selection of the site difficult. Also described are three aspects of the project's construction: (1) river management, involving the use of substantial temporary-works buttress dam; (2) embankment fill, most of which is transported by conveyor belt; and (3) contractual arrangements, whereby resources are mobilized on a global scale. When completed, this hydroelectric power project will be the largest in Pakistan with the main embankment dam being the largest in the world. (Bahre-Ariz.)

GEOHYDROLOGY OF THE CROSS-FLORIDA BARGE CANAL AREA WITH SPECIAL REFERENCE TO THE OCALA VICINITY,
Geological Survey, Tallahassee, Fla.
G. E. Faulkner.
Water Resources Investigations 1-73, March 1973. 117 p, 35 fig, 3 tab, 66 ref.

Descriptors: *Hydrogeology, *Canal construction, *Inland waterways, *Florida, Water quality, Environmental effects, Aquifers, Water chemistry, Mixing, Atlantic Ocean, Gulf of Mexico, Groundwater, Surface waters, Groundwater movement, Groundwater recharge, Discharge (Water), Engineering structures.
Identifiers: *Cross-state canal (Fla), Barge Canal.

The Cross-Florida Barge Canal will extend from Palatka on the St. Johns River southwestward 110 miles to the Gulf of Mexico near Yankeetown. It will be 150 feet wide, have a minimum water depth of 12 feet, and have five locks. From near Ocala northeastward, the canal channel will be in sandy and clayey sediments overlying and confining the Floridan Aquifer, which consists of cavernous limestone. Here, exchange of water between the canal and the Floridan Aquifer will be small. Westward from Ocala, the Floridan Aquifer is unconfined and the canal will be excavated into cavernous limestone below the water table. Here, exchange of water will be direct between the canal and the aquifer. In most places flow will be from the aquifer to the canal, but in the 28-mile summit reach, the canal will simultaneously gain and lose water most of the time. Two zones of outflow from the canal to the aquifer are probable in the summit reach. Of principal importance is a 4-mile reach of the canal from which water will enter the aquifer and move toward Silver Springs 5 miles to the north. (Woodard-USGS)
W73-14807

SALT-WATER MOVEMENT IN THE LOWER WITHLACOOCHEE RIVER--CROSS-FLORIDA BARGE CANAL COMPLEX,
Geological Survey, Tallahassee, Fla.
P. W. Bush.

Descriptors: *Saline water intrusion, *Estuaries, *Canals, *Florida, Environmental effects, Canal construction, Streamflow, Flow rates, Discharge (Water), Tidal effects, Gulf of Mexico.
Identifiers: *Withlacoochee River (Fla), *Cross-Barge Canal (Fla).

Construction of the west end of the Cross-Florida Barge Canal changed the regimen of the lower Withlacoochee River. An investigation was made to determine how saltwater from the Gulf of Mexico moves in the river-canal complex, and how the factors that control saltwater movement--tides and discharges--have changed since canal construction. In the river below the bypass channel, saltwater moves inland as a wedge beneath the freshwater with upstream tidal flows and back toward the Gulf with downstream tidal flows. Freshwater discharge during the investigation ranged from 500 to 1,500 cfs. The only time that freshwater discharge clearly showed an effect on upstream saltwater movement was the 4-day period when discharge was reduced to about 500 cfs. Tides seem to have a stronger influence on upstream movement of the salt front than discharge in the 500- to 1,500-cfs range. For instance, the estimated farthest upstream movement of the salt front dur-

ing the investigation occurred when discharge was 1,320 cfs. The point of maximum intrusion on this occasion was about 4.8 miles upstream from the river entrance. The event must be uncommon, as saltwater was present on the bottom at the station 3.3 miles from the river entrance only 1.7% of the total time during the year of record. (See also W73-14809) (Woodard-USGS)
W73-14808

GROUND-WATER CONDITIONS IN THE LOWER WITHLACOOCHEE RIVER--CROSS-FLORIDA BARGE CANAL COMPLES AREA,
Geological Survey, Tallahassee, Fla.
G. L. Faulkner.
Water Resources Investigations 4-72, January 1973. 31 p, 11 fig, 2 tab, 8 ref.

Descriptors: *Hydrology, *Canal construction, *Inland waterways, *Florida, *Water quality, Environmental effects, Aquifers, Groundwater movement, Water chemistry, Saline water intrusion, Drainage effects, Water wells, Water level fluctuations, Surface waters, Groundwater recharge.
Identifiers: *Cross-Florida Barge Canal, *Withlacoochee River.

Construction of the westernmost 7-mile reach of the Cross-Florida Barge Canal, which intersects the lower Withlacoochee River 9 miles above its mouth, was begun in 1965 and was completed in 1969. The river channel and the canal penetrate the cavernous limestone of the Floridan Aquifer below the water table. Groundwater levels in a 15-square mile area centered at the canal about 4.5 miles from the Gulf of Mexico are 0.5 foot to 15 feet lower than if the canal had not been built. In another 0.7-square mile area surrounding the Inglis Lock bypass channel the groundwater level has been raised 0.5 foot to 20 feet above the pre-canal level. The average groundwater contribution to the flow of the lower river is 20% less (7 cfs) than before the canal was built. This is about 0.5% of the average freshwater flow that would have passed down the river from October 1, 1970, through September 30, 1971, if the canal had not been built. The freshwater-saltwater zone of diffusion in the aquifer tends to rise in the area where the groundwater levels have been lowered. (See also W73-14808) (Woodard-USGS)

PLANE JET ON SLOPING FLOORS UNDER FINITE SUBMERGENCE,
Department of the Environment, (Alberta). Water Resources Div.
V. Mura Hari.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY9, Paper 10027, p 1449-1460, September 1973. 8 fig, 1 tab, 5 ref, append.

Descriptors: *Jets, *Boundary layers, *Hydraulic jump, Turbulent flow, Equations, Hydrodynamics, Slopes.
Identifiers: Submerged flow, Sloping floors.

The mean flow characteristics of two-dimensional turbulent jets diffusing on sloping floors under submergence were examined. The turbulent wall-jet model was used to derive simple power-law type mathematical expressions for the decay of jet velocity, growth of the jet and the bed shear stress distribution. These mathematical predictions were compared with experimental observations. Observations were also made on the velocity distribution in the boundary layer and presented graphically. (Knapp-USGS)

Descriptors: *Seepage, *Laplaces equation, *Cofferdams, *Sheet piling, Groundwater movement, Mathematical studies, Dimensional analysis.

Steady saturated seepage through a homogeneous porous medium is governed by Laplace's equation. The real and imaginary parts of an analytic function of a complex variable, being the solutions of Laplace's equation, represent the potential and stream functions of two-dimensional seepage problems. The Weierstrass zeta function transforms conformally a rectangle into the geometry of a sheet pile cofferdam and yields the potential and stream functions in the flow field. The Weierstrass P-function gives the velocity distribution. By a simple modification of the zeta function, a general transformation function maps the same rectangle into cofferdams with widely different shape parameters having identical seepage flux parameter. The relationship between two zeta functions whose period ratios are reciprocal to each other are deduced. The computation for drawing the flow nets of two different groups of cofferdams with the seepage flux parameter of one group being the reciprocal of the other are practically the same. Application of this result decreases the computational effort immensely. (Knapp-USGS)

. C. Melrose.
ociety of Petroleum Engineers Journal, Vol 5, No , p 259-271, September 1965. 7 fig, 1 tab, 42 ref.

Descriptors: *Capillary action, *Surface tension, Porous media, *Wettability, Wetting, Hysterisis, Drainage, Surfaces, Pores, Unconsolidated sediments, Earth-water interfaces.
Identifiers: *Ideal soil model, Capillary tube, Contact angle, *Imbibition, *Interfacial tension, Pendular ring interface, Particle packing.

A mathematical analysis was made of the role of wettability in capillary action in porous media. A comparison of the applicability of cylindrical capillary tube concept with that of the 'ideal soil model' showed that the capillary tube model was not applicable to situations which involve varying wettability. The ideal soil model considers the porous medium as composed of spherical particles of uniform size, with packing of the spheres either simple cubic or rhombohedral. The ideal soil model predicts that the pore structure of typical porous solids will lead to hysteresis effects in capillary pressure, even if a zero value of the contact angle is maintained. The model was generalized to situations in which the contact angle takes on values between zero and 40 degrees. For the imbibition branch of the capillary-pressure function, the model predicts a considerable departure from the usually assumed cos theta relationship. It is possible, according to the model, that a displaced wetting phase will not be able to reimbibe, even when the contact angle does not exhibit hysteresis. (Gray-NWWA)

SIZING GRAVEL-PACK-LINER SLOTS IN OIL AND GAS WELLS,
E. B. Rogers, Jr.
Oil and Gas Journal, Vol 69, No 5, p 58-60, November 8, 1971. 3 fig.

Descriptors: Oil industry, *Wells, *Wells screens, Size, *Oil wells.
Identifiers: Mud packs, *Gravel sizing, *Gravel pack implacement, Well completion practices.

The choosing and implacement of a gravel pack and liner are discussed. The sizing of slots for a gravel pack liner is based on a slightly different philosophy than the sizing of screen slots. In the latter case there is essentially unlimited supply of formation material to furnish larger grains to bridge the slots. In the case of gravel packs, there is only a finite amount of gravel outside the liner. If more than a small amount of the pack material passes before a bridge is formed, the pack has in effect disappeared. Therefore, gravel-pack-liner slots are more conservatively designed. Three formulas for sizing criteria are presented. The common types of packs are illustrated and methods of implacement are discussed. Improper completion practices or placement techniques may result in poor efficiency even though proper sizing was achieved. Primary factors for successful completion are presented. (Hunt-NWWA)

Descriptors: *Fracture permeability, *Fractures (Geologic), Permeability, Flow, Poisson ratio, Tensile stress, Tensile strength, Pressure, Reynolds number.
Identifiers: *Hydraulic fractures, *Fracture design charts, *Fracture dimensions, Linear fracture, Radial fracture, Propping agent, Spurt loss.

In the process of hydraulic fracturing, the liquid pressure in the borehole is increased until tensile stress in the surrounding rock exceeds tensile strength. The tensile fracture then is penetrated by liquid from the borehole and fracture propogation under continuous hydraulic action occurs. The fracturing liquid may carry a propping agent. Prediction of fracture width and areal extent before release of pressure is dependent on the applicability of a number of simplifying assumptions. If these assumptions are granted, the fracture extension process can be formulated mathematically and equations derived for fracture width and shape, and the effect of formation permeability on fracture dimensions. Fracture design charts were devised and their application to field operations is illustrated. (Gray-NWWA)

AN APPLICATION OF LOUVER DEFLECTORS FOR GUIDING ATLANTIC SALMON (SALMO SALAR) SMOLTS FROM POWER TURBINES,
Department of the Environment, Halifax (Nova Scotia). Fisheries Service.
L. J. A. Ducharme.
J Fish Res Board Can. Vol 29, No 10, p 1397-1404. 1972. Illus.
Identifiers: *Atlantic salmon, *Canada (Nova Scotia), Louver deflectors, Power turbines, Salmo-Salar, Salmon, Smolts, *Fish guiding.

Louver deflectors for guiding S. salar away from destructive power turbines were installed in a canal leading to the powerhouse at East River, Sheet Harbour, Nova Scotia (Canada), in 1966. Guiding efficiency studies, using hatchery-reared smolts, showed that a minimum approach:bypass velocity ratio of 1.0:1.5 was prerequisite to high guiding efficiency. From 1967 to 1971, average guiding efficiency was increased from 57% to 80% through modifications which increased velocity and reduced flow turbulence in the bypass. A significant correlation existed between approach velocity and guiding efficiency with the range tested after bypass hydraulics had been modified. Tests conducted with varying louver bar spacing ranging from 5.1-30.5 cm (2-12 in.) showed that the wider spacings did not impair guiding efficiency. Vertical distribution of smolt migrants in the power canal indicated that over 80% of the fish remained above depth 1.3 m. This was borne out by the fact that the bypass was effective when operating to a depth of only 0.91 m. An appraisal of the practicality of the louver guiding system is presented.--Copyright 1973, Biological Abstracts, Inc.

THE BEHAVIOR OF ADULT AMERICAN SHAD (ALOSA SAPIDISSIMA) DURING MIGRATION FROM SALT TO FRESH WATER AS OBSERVED BY ULTRASONIC TRACKING TECHNIQUES,
McGill Univ., Montreal (Quebec). Dept. of Biology.
J. J. Dodson, W. C. Leggett, and R. A. Jones.
J Fish Res Board Can. Vol 29, No 10, p 1445-1449, 1972. Illus.
Identifiers: Alosa-sapidissima, Physiological adaptation, *Shad, *Ultrasonic tracking, Fish migration, Fish behavior.

Five of 7 adult A. sapidissma, tracked continuously with ultrasonic transmitters in the lower estuary of the Connecticut River in 1968 during their spawning migration of fresh water, exhibited extensive meandering, ranging 24-53 hr in duration in the region of the saltwater-freshwater interface. The salinity in the Connecticut River is like a wedge; its daily position is dependent on upland discharge, and its hourly position is dependent on tidal activity. The fish were observed during all tidal conditions and at several discharge rates, and in all cases they remained near the leading edge of salt water during the meandering phase. This behavior pattern was not a result of handling nor was it a typical behavioral response to tidal cycle. The meandering observed in the region of the saltwater-freshwater interface was due to physiological adaptation of the fish to fresh water. Of the remaining 2 shad tagged, 1 proceeded directly upstream without meandering, and 1 moved downstream.--Copyright 1973, Biological Abstracts, Inc.

CORRELATIONS BETWEEN ALEWIFE ACTIVITY AND ENVIRONMENTAL VARIABLES AT A FISHWAY,
Rhode Island Univ., Kingston. Marine Experiment Station.
S. B. Saila, T. T. Polgar, D. J. Sheehy, and J. M. Flowers.
Trans Am Fish Soc. Vol 101, No 4, p 583-594. 1972. Illus.
Identifiers: *Alewife, Alosa-Pseudoharengus, Environmental variables, *Fishway, *Rhode Island (Annaquatucket River), Fish counting, Monitoring.

An automatic recording system for fish counting and for the monitoring of water temperature, dissolved O2 pH and solar radiation was employed on a newly constructed fishway on the Annaquatucket River, North Kingstown, Rhode Island. Records of fishway utilization by the alewife, Alosa pseudoharengus and of the environmental variables were critically examined by time series autocorrelation and crosscorrelation techniques. It was demonstrated that migratory activity was hormonic with a diurnal periodicity and was closely associated with incident solar radiation. Suggestions for an improved monitoring system and further analysis were made.–Copyright 1973, Biological Abstracts, Inc.

APPLIED WATER CHEMISTRY AT WASHINGTON STATE UNIVERSITY,
Washington State Univ., Pullman. Dept. of Civil and Environmental Engineering.
E. Hindin.
In: Preprints of Papers Presented at 166th National Meeting of American Chemical Society, August 1973, Chicago, Ill: American Chemical Society, Division of Environmental Chemistry, Vol 13, No 2, Paper 27, p 92-94, 1973. EPA Grant WP-170-05 (T900-208).

Descriptors: *Education, *Universities, *Grants, Water chemistry, Environment, Ecology, Water pollution control, *Washington.
Identifiers: Washington State University.

Through support from the professional training grants program of the Office of Water Programs of the Environmental Protection Agency, a plan of studies in applied water chemistry was initiated at Washington State University during the 1971-72 academic year. The aim of the plan of studies is to train persons to meet the needs of federal, state, local and industrial entities where the monitoring, analysis and data evaluation of the various segments of the aquatic environment are performed. The plan of studies is multidisciplinary in nature due to the existence of common principles and extensive interrelationships among various disciplines within the Departments of Chemistry, Civil Engineering and Soils. The plan of studies, administered by the Applied Water Chemistry subcommittee of the Environmental Science Program, leads to a Masters of Science degree in Environmental Science. The plan is directed primarily to holders of undergraduate degrees in Chemistry, Chemical Engineering or in any of the physical, biological or environmental sciences with a strong background in chemistry. ANNUAL REPORT OF ACTIVITIES DURING FISCAL YEAR 1973.
Maine Univ., Orono. Land and Water Resources Inst.

Available from the National Technical Information Service as PB-223 869, $3.00 in paper copy, $1.45 in microfiche. Annual Report No 9, July 1973. 25 p. OWRR A-999-ME (10).

Descriptors: *Water resources development, *Maine, Bibliographies, *Projects, Abstracts, Universities, State governments, Surface waters, Water pollution sources, Water pollution effects, Lakes, Streams, Aquatic life, Ecosystems, Environmental effects, Biology, Water quality, Sediments, *Water Resource Institute.
Identifiers: *Annual projects report.

From its inception in 1965 the Land and Water Resources Institute of the University of Maine consistently has followed a policy of working with local, state and regional water users and officials to define and resolve water resources problems. Projects in progress by the Institute during the 1973 FY include: a predictive model for sludge characterization useful to design and control of sludge dewatering processes in water recycle systems; phosphate retention by lake sediments; the effects of burrowing tubificid worms on the exchange of phosphorus between lake sediments and overlying water; a study of the physico-chemical parameters affecting the removal of colloidal particles by porous media; dissolved pollution product gases in natural waters; political and environmental attitudes or voters and public officials related to alternative levels of water quality and correlated alternative systems of management of the Penobscot River; the historic and present relationships between phytoplankton, limiting nutrients, and sediment-water geochemical processes in selected Maine lakes; the effects of PCB's and selected herbicides on the biology and growth of Platymonas Subcordiformis and other algae; the macroinvertebrate fauna of a Maine salmon river subjected to long-term multiple pesticide contamination; septic tank effluent movement through soils, adsorption as a protective mechanism for water-borne viruses; and effect of development in the mountainous regions of Maine on water quality. (Woodard-USGS)

NINTH ANNUAL REPORT WATER RESOURCES RESEARCH CENTER.
Minnesota Univ., St. Paul. Water Resources Research Center.

Available from the National Technical Information Service as PB-224 058, $7.75 in paper copy, $1.45 in microfiche. Bulletin 61, August 1973. 107 p. OWRR A-999-MINN (29). 14-31-0001-3823.

Descriptors: *Research, *Water resources, *Minnesota, Education, *Projects, Expenditures, Manpower, Water management, Water pollution, Water resources reserach act, *Water Resource Institute.
Identifiers: Researchers, Applied Research, Basic research, Physical-Biological-Economic-Social Aspects, Faculty.

The Fiscal year 1973 budget of the Center was $413,724. The Center supported 18 research projects involving 19 faculty members. These research projects were concerned with: mathematical watershed system analysis, aquatic plants, eutrophic lakes, groundwater basin information, water resources research planning, soil water movement, Mississippi river ecology, perception of water resources problems, financing of water resources development, water pollution and social factors, forest management, water resources policies, sub-surface irrigation, flood forecasting, water policy decisions, precipitation variations, and floods. About 51 students received employment through the Center's program. During fiscal year 1973, there were 32 reports generated through research projects. (Walton-Minnesota)

CHLORINATED DIBENZOFURNAS
Oral Toxicity of Chlorinated Dibenzofurans to Juvenile Atlantic Salmon,
W73-15092 5C

CHLORINATED HYDRO-CARBON PESTICIDES
The Determination of Chlorinated Aliphatic Hydrocarbons in Air, Natural Waters, Marine Organisms, and Sediments,
W73-14952 5A

CHLORINATED HYDROCARBON PESTICIDES
Temperature Selection of Atlantic Salmon (Salmo Salar) and Brook Trout (Salvelinus Fontinalis) as Influenced by Various Chlorinated Hydrocarbons,
W73-15097 5C

Transport, Distribution, and Degradation of Chlorinated Hydrocarbon Residues in Aquatic Model Ecosystems,
W73-15103 5B

CHLORINATED HYDROCARBONS
Sensitivity of Dunaliella and Scenedesmus (Chlorophyceae) to Chlorinated Hydrocarbons,
W73-15114 5C

CHLORINATION
Virus Inactivation by Chlorine Dioxide and Its Application to Storm Water Overflow,
W73-14798 5D

Some Reactions of Chlorine and Oxy-Chlorine Species with Organic Compounds in Aqueous Media,
W73-14799 5B

The Chemistry of Aqueous Nitrogen Trichloride,
W73-14800 5B

Recycle, What Disinfectant for Safe Water Then,
W73-14802 5D

Dechlorination by Activated Carbon,
W73-14803 5D

Design of Activated Carbon Adsorbers for Aqueous Chlorine Removal Based on the Mechanism of Removal,
W73-14804 5F

Effectiveness of Chlorine in Eliminating Bacteria and Viruses from Tertiary Treated Wastewater,
W73-14805 5D

Disinfection of Wastewater Effluents for Virus Inactivation,
W73-14806 5D

Handbook of Chlorination for Potable Water, Wastewater, Cooling Water, Industrial Processes, and Swimming Pools,
W73-14915 5F

Chlorinated Urban Water: A Cause of Dialysis-Induced Hemolytic Anemia,
W73-14928 5F

CHLORINE
Comparative Death Kinetics of Indicator Microorganisms Upon Halogen Disinfection,
W73-14790 5D

The Chemistry of Bromine Chloride in Waste Water Disinfection,
W73-14791 5D

The Comparative Mode of Action of Chlorine, Bromine, and Iodine on F2 Bacterial Virus,
W73-14792 5D

Bromine Disinfection of Waste Water Effluents,
W73-14793 5D

Wastewater Disinfection of Trickling Filter Effluent with Bromine and Chlorine,
W73-14794 5D

Bromine, Chlorine, and Iodine Compared as Disinfectants for Amoebic Cysts,
W73-14795 5D

The Chemistry of Aqueous Nitrogen Trichloride,
W73-14800 5B

Handbook of Chlorination for Potable Water, Wastewater, Cooling Water, Industrial Processes, and Swimming Pools,
W73-14915 5F

Sanitary Conditions of Wells on Highways of the Vinnitsa District and Measures to Improve their Water Quality, (In Russian),
W73-15276 5F

CHLORINE DIOXIDE
Virus Inactivation by Chlorine Dioxide and Its Application to Storm Water Overflow,
W73-14798 5D

Some Reactions of Chlorine and Oxy-Chlorine Species with Organic Compounds in Aqueous Media,
W73-14799 5B

CHLOROPHYTA
Transport, Distribution, and Degradation of Chlorinated Hydrocarbon Residues in Aquatic Model Ecosystems,
W73-15103 5B

Growth and Toxicity Tests on the Marine Nanoplanktonic Alga Platymonas Tetrathele G.S. West in the Presence of Crude Oil and Emulsifiers,
W73-15106 5C

Sensitivity of Dunaliella and Scenedesmus (Chlorophyceae) to Chlorinated Hydrocarbons,
W73-15114 5C

Growth of Dictyosphaerium, Selenastrum, and Scenedesmus (Chlorophyceae) in a Dilute Algal Medium,
W73-15116 5C

Some Desmids from Uganda,
W73-15208 5C

CHOLLA GROWTH
Growth Characteristics of Opuntia Imbricata (Haw.) DC. In New Mexico,
W73-14954 2I

CHROMIC OXIDE
Chromic Oxide and Crude Protein Excretion in the Bovine as Influenced by Water Restriction,
W73-15182 5B

CHRYSOPHYTA
Algae of the Cho-Oyu (E. Himalayas) Expedition-II, Bacillariophyceae-II,
W73-15094 5A

CITRUS
Marginal Values of Water Used in the Irrigation of Citrus in the Central Ridge Section of Florida,
W73-14760 3F

CLADOCERA
Some Cladocera and Copepods from the Upper Klamath River Basin,
W73-15294 5C

CLEAR-CUTTING
Deforestation Effects on Soil Moisture, Streamflow, and Water Balance in the Central Appalachians,
W73-14919 4D

CLIMATE
Climatological Notes of 1972 - Minnesota,
W73-14763 2B

CLIMATES
Climate and the Selection of a Beef Waste Management System,
W73-15183 5D

CLIMATIC DATA
Application of the Grid Square Technique to Mapping of Evapotranspiration,
W73-14824 2D

CLIMATOLOGY
Some Measures of Agricultural Drought,
W73-15064 3F

CLOPHEN A 50
Transport, Distribution, and Degradation of Chlorinated Hydrocarbon Residues in Aquatic Model Ecosystems,
W73-15103 5B

CLOSED CONDUITS
The Bath Story - New Kennebec River Subaqueous Water Main,
W73-15025 8A

CLOUD SEEDING
Weather Modification Activities in Texas, 1970-72.
W73-14998 3B

The Role of Weather Modification in Drought Relief,
W73-15069 3B

COAL MINES
Utilisation of Disused Coal Mines as Water Storage Reservoirs,
W73-14827 4B

COASE THEOREM
Public Investment Criteria for Water Oriented Recreation in the Lake Erie Basin,
W73-14774 6D

COASTAL AREAS
Coastal Zone Management Act: A Broader Scope for State Initiative,
W73-15142 6E

COASTAL ZONE MANAGEMENT ACT OF 1972
The Federal Coastal Zone Management Act of 1972,
W73-15148 6E

COASTS
Coastal Zone Management Act: A Broader Scope for State Initiative,
W73-15142 6E

The Federal Coastal Zone Management Act of 1972,
W73-15148 6E

COBALT
Similarities Between MN, NI and CO Contents of Deep-Sea Clays and Manganese Nodules From the South-West Region of the North Atlantic,
W73-14816 2J

Iron, Manganese, Cobalt, and Zinc Cycles in a South Carolina Reservoir,
W73-15251 5B

COELENTERATES
Behavior of the Planktonic Coelenterates, Sarsia Tubulosa, Phialidium Gregarium, and Pleurobrachia Pileus in Salinity Discontinuity Layers,
W73-15098 5C

COFFERDAMS
Seepage Into Sheet Pile Cofferdam,
W73-14843 8B

COHO SALMON
Absence of Acute Effects on Threespine Sticklebacks (Gasterosteus aculeatus) and Coho Salmon (Oncorhynchus kisutch) Exposed to Resuspended Harbor Sediment Contaminants,
W73-15095 5C

Some Physiological Aspects of Sublethal Heat Stress in the Juvenile Steelhead Trout (Salmo gairdneri) and Coho Salmon (Oncorhynchus Kisutch),
W73-15121 5C

COLD RESISTANCE
Growth Temperature Requirements and Lower Lethal Temperatures for Juvenile Smallmouth Bass (Micropterus Dolomieui),
W73-15101 5C

COLONIZATION
Microfungi Colonizing Submerged Standing Culms of Phragmites Communis Trin,
W73-15131 5C

Microfungi Colonizing Collapsed Aerial Parts of Phragmites Communis Trin. in Water,
W73-15132 5C

COLOR
New Adsorption Process for Removing Color from Kraft Mill Effluents,
W73-14784 5D

Effects of Oxygen Pulping on Toxicity and Colour of Effluent,
W73-15188 5G

On Spent Semichemical Pulping Liquors. (I). Species Variation of Pulping Timbers Color and Chemical Oxygen Demand, (In Japanese),
W73-15189 5B

COLORADO
Mathematical Modeling of Urban Water Management Strategies,
W73-14757 6B

Geologic Appraisal of Paradox Basin Salt Deposits for waste Emplacement,
W73-14820 5B

Legal Constraints on Urban Water Systems,
W73-14905 3D

Temporal and Spatial Variation of Parameters for the Distribution of N-Day Precipitation,
W73-15073 2B

Interim Plan for Water Quality Management in the Denver Metropolitan Area-Addendum No 2.
W73-15201 5G

COLORADO RIVER
Effects of Development on Salinity and Limnology of the Lower Colorado River,
W73-14756 5C

COLUMBIA RIVER
Columbia River Thermal Effects Study: Reactor Effluent Problems,
W73-15118 5C

COMBINED SEWERS
Sewerage and Sewage Disposal: Administrative and Technical Principles,
W73-15029 5G

COMMON LAW
Quo Warranto to Enforce a Corporate Duty Not to Pollute the Environment,
W73-15155 5G

COMPARATIVE COSTS
An Economic Comparison of Short and Full Season Cotton Production in Arizona,
W73-15217 3F

COMPREHENSIVE PLANNING
Factors Affecting Innovation in Water Quality Management: Implementation of the 1968 Michigan Clean Water Bond Issue,
W73-14871 5G

Water Planning Models in North Atlantic Study,
W73-14908 6D

Final Environmental Statement Related to Operation of Enrico Fermi Atomic Power Plant - Unit 2.
W73-14979 5B

Final Environmental Statement Related to Operation of Duane Arnold Energy Center.
W73-14980 5B

Comprehensive Area-Wide Water and Wastewater Facilities Plan and Program for the Mid-Cumberland Region of Tennessee.
W73-15196 6B

Final Environmental Statement Related to Operation of Virgil C. Summer Nuclear Station Unit 1.
W73-15235 5B

Final Environmental Statement Related to Operation of Quad-Cities Nuclear Power Station Units 1 and 2.
W73-15236 5B

Final Environmental Statement Related to Operation of Cooper Nuclear Station.
W73-15237 5B

Final Environmental Statement Related to Operation of Turkey Point Plant, Units 3 and 4.
W73-15243 5B

Final Environmental Statement Related to the Prairie Island Nuclear Generating Plant.
W73-15256 5C

COMPUTER MODELS
A Computer-Implemented Instructional Game for Evaluating Water Management Alternatives,
W73-14772 6B

Modeling and Simulation of Reservoirs to Predict Evaporation Reduction by Surface Films,
W73-14868 3B

COMPUTER PROGRAMS
Application of the Grid Square Technique to Mapping of Evapotranspiration,
W73-14824 2D

An Appraisal of the Computation of Statistical Parameters in Grain Size Analysis,
W73-15264 2J

CONDUCTIVITY
Calculation of Water Quality from Electrical Logs Theory and Practice,
W73-15193 2K

CONFERENCES
Conference on the Hydrologic Cycle in Nature and Its Role in Formation of Freshwater Resources (Soveshchaniye po probleme 'Vlagooborot v prirode i yego rol' v formirovanii resursov presnykh vod'),
W73-15013 2A

Fourth All-Union Hydrology Congress (IV Vsesoyuznyy gidrologicheskiy s'yezd),
W73-15015 2A

Twenty-Fifth Hydrochemistry Conference (XXV Gidrokhimicheskoye soveshchaniye),
W73-15016 2A

CONIFEROUS FORESTS
The Radiation and Energy Balances of Coniferous and Deciduous Forests,
W73-14870 2I

CONNECTICUT
Metropolitan District Water Supply System, Hartford, Connecticut: Design Features of the Water Treatment Plant at Reservoir Six,
W73-15206 5F

CONNECTICUT RIVER
Vulnerability and Survival of Young Connecticut River Fish Entrained at a Nuclear Power Plant,
W73-15100 5C

CONTACT ANGLE
Wettability as Related to Capillary Action in Porous Media,
W73-15195 8D

CONTINENTAL SHELF
Suspended Sediment Transport From the Gironde Estuary (France) Onto the Adjacent Continental Shelf,
W73-14813 2L

The Bottom Sediments of the Amazon Shelf and Tropical Atlantic Ocean,
W73-14814 2J

Synoptic Measurements of Currents and Sediment Transport on the Continental Shelf, (Annual Progress Report),
W73-15242 5B

Storm-Generated Current in La Jolla Submarine Canyon, California,
W73-15268 2E

CONTINUOUS CULTURES
Growth and Cell-Size Distribution of Marine Planktonic Algae in Batch and Dialysis Cultures,
W73-15128 5C

CONTRACTS
Iaea Research Contracts, Thirteenth Annual Report.
W73-14960 5G

CONTROL SYSTEMS
Design and Control of Transient Waste Treatment Processes,
W73-14762 5D

Environmental Monitoring Helps Resolve Pollution Problems,
W73-14917 5A

COOLING TOWERS
Vulnerability and Survival of Young Connecticut River Fish Entrained at a Nuclear Power Plant,
W73-15100 5C

COOLING WATER
Handbook of Chlorination for Potable Water, Wastewater, Cooling Water, Industrial Processes, and Swimming Pools,
W73-14915 5F

Analysis of High-Purity Water by Flameless Atomic Absorption Spectroscopy I The Use of an Automated Sampling System,
W73-14955 5A

Analysis of High-Purity Water by Flameless Atomic Absorption Spectroscopy. II. Signal Integration With a Non-Resonance Line Correction System for Spurious Absorption Phenomena,
W73-14956 5A

COPEPODA
Some Cladocera and Copepods from the Upper Klamath River Basin,
W73-15294 5C

COPEPODS
Wax Esters in Tropical Zooplankton and Nekton and the Geographical Distribution of Wax Esters in Marine Copepods,
W73-15117 5B

COPPER
Ion Selective Flow-Through Electrodes: Construction and Properties of Heavy Metal Sensors,
W73-15170 5A

COPPER COMPOUNDS
Controlling Iron and Copper Deposits in Modern High-Pressure Boilers,
W73-15187 5F

CORAL REEF
Phosphorus Flux Across A Coral Reef,
W73-14892 5B

COSMARIUM SPP
Some Desmids from Uganda,
W73-15208 5C

COSMIC RAYS
Tritium in the Atmosphere and Ocean,
W73-14965 5B

COST ANALYSIS
Prospects of Increasing Freshwater Resources in the USSR Through Desalting of Saline and Brackish Waters (Perspektivy uvelicheniya resursov presnykh vod na territorii SSSR za schet opresneniya solenykh i solonovatykh vod),
W73-14854 3A

COST-BENEFIT ANALYSIS
Planning the Development of the Nestos River,
W73-14907 4A

Least-Cost Design of Water Distribution Systems,
W73-14911 4A

A General Perspective Concerning the Cost of Pollution Abatement at any Specified Level,
W73-14921 5D

An Economic Comparison of Short and Full Season Cotton Production in Arizona,
W73-15217 3F

COSTS
Simple Apparatus for Conducting Acute Toxicity Bioassays Under Field Conditions,
W73-15084 5A

COTTON
An Economic Comparison of Short and Full Season Cotton Production in Arizona,
W73-15217 3F

COVER UTILIZATION
Cover Response of Fish in Bioassay of Acid Water,
W73-14901 5C

CRANIOTOMY
Hypothalamic Temperature Regulation in Cattle,
W73-15174 5B

CRAYFISH
Uptake and Retention of Tungsten-181 by Crayfish (Cambarus longulus longerostris Ort.),
W73-15250 5B

CROP PRODUCTION
An Economic Comparison of Short and Full Season Cotton Production in Arizona,
W73-15217 3F

CROP YIELD
Influence of Irrigation on the Yield and Persistence of Forage Legumes,
W73-15295 3F

CROPPING PATTERNS
Irrigation Canal System Capacity Design Criteria,
W73-14906 3F

CROPS
Indirect Radioactive Contamination of the Food Chain. Determination of The Factors of Transfer, Soil/Agricultural Produce, Soil/Milk, in the European Community,
W73-14984 5B

CROSS-BARGE CANAL (FLA)
Salt-Water Movement in the Lower Withlacoochee River--Cross-Florida Barge Canal Complex,
W73-14808 8B

CROSS-FLORIDA BARGE CANAL
Ground-Water Conditions in the Lower Withlacoochee River--Cross-Florida Barge Canal Comples Area,
W73-14809 8B

CROSS-STATE CANAL (FLA)
Geohydrology of the Cross-Florida Barge Canal Area with Special Reference to the Ocala Vicinity,
W73-14807 8B

CRUDE OIL
Growth and Toxicity Tests on the Marine Nanoplanktonic Alga Platymonas Tetrathele G.S. West in the Presence of Crude Oil and Emulsifiers,
W73-15106 5C

Abundance, Distribution and Oil Biodegradation Potential of Microorganisms in Raritan Bay,
W73-15108 5C

CTENOPHORA
Behavior of the Planktonic Coelenterates, Sarsia Tubulosa, Phialidium Gregarium, and Pleurobrachia Pileus in Salinity Discontinuity Layers,
W73-15098 5C

CULTURES
Growth of Dictyosphaerium, Selenastrum, and Scenedesmus (Chlorophyceae) in a Dilute Algal Medium,
W73-15116 5C

Biodegradation of Oleates,
W73-15127 5B

Growth and Cell-Size Distribution of Marine Planktonic Algae in Batch and Dialysis Cultures,
W73-15128 5C

CUMBERLAND RIVER (TENN)
Comprehensive Area-Wide Water and Wastewater Facilities Plan and Program for the Mid-Cumberland Region of Tennessee.
W73-15196 6B

CURRENTS (WATER)
Prediction of Near-Surface Drift Currents From Wind Velocity,
W73-14834 2E

Eutrophication of Sheltered Bays in a Large Lake,
W73-14875 5C

Storm-Generated Current in La Jolla Submarine Canyon, California,
W73-15268 2E

No Current Reversal at 10,000 B.P. In the Strait of Gibraltar,
W73-15273 2E

CYANOPHYTA
The Detection of a Bound Ferredoxin in the Photosynthetic Lamellae of Blue-Green Algae and other Oxygen Evolving Photosynthetic Organisms,
W73-14882 5C

Growth, Gas Vacuolation and Buoyancy in a Natural Population of a Plantonic Blue-Green Alga,
W73-15022 5C

Blue-Green Algal Flora of Rajasthan,
W73-15130 5C

CYTOLOGICAL STUDIES
A Rapid Method for Clearing Diatoms From Taxonomic and Ecological Studies,
W73-15115 5A

CZECHOSLOVAKIE (ZITNEG OSTROV)
Study of the Helminth Fauna of Domestic Animals in Area of Danube Power Station: III. Helminth Fauna of Water Fowls in Zitny Ostrov (Czechoslovakia). (In Czech),
W73-15280 2I

DAMBOS
Hydrology of Seasonally Inundated African Headwater Swamps,
W73-14825 2A

DAMS
Gillham Lake, Cossatot River, Arkansas, Appendix IV, Appendix V, Appendix VI (Final Environmental Impact Statement).
W73-15138 4A

Environmental Defense Fund, Inc. V. Armstrong (Action by Environmental Protection Groups Against Commissioner of Bureau of Reclamation and Others for Injunctive Relief with Respect to the Proposed New Melones Dam).
W73-15146 6E

Ririe Dam and Lake, Willow Creek, Idaho (Final Environmental Impact Statement).
W73-15162 4A

DAMSITES
Days Creek Lake Project, SOUTH Umpqua River, Douglas County, Oregon, (Final Environmental Statement).
W73-15017 4A

Tarbela Dam Project, Pakistan,
W73-15211 8A

DANUBE
Study of the Helminth Fauna of Domestic Animals in Area of Danube Power Station: III. Helminth Fauna of Water Fowls in Zitny Ostrov (Czechoslovakia). (In Czech),
W73-15280 2I

DATA COLLECTIONS
Risks From Using Inadequate Flood Records,
W73-15053 2E

Data File on Metal Distribution in East African Rift Sediments,
W73-15262 2J

DATA INTERPRETATION
Phytoplankton Organization in Baie Des Chaleurs (Gulf of St Lawrence),
W73-15111 2L

DATA PROCESSING
Application of the Grid Square Technique to Mapping of Evapotranspiration,
W73-14824 2D

DAYS CREEK (ORE)
Days Creek Lake Project, SOUTH Umpqua River, Douglas County, Oregon, (Final Environmental Statement).
W73-15017 4A

DDE
Transport, Distribution, and Degradation of Chlorinated Hydrocarbon Residues in Aquatic Model Ecosystems,
W73-15103 5B

DDT
Effects of Exposure to Sublethal DDT on the Exploratory Behavior of Goldfish (Carassium auratus),
W73-15085 5C

Transport, Distribution, and Degradation of Chlorinated Hydrocarbon Residues in Aquatic Model Ecosystems,
W73-15103 5B

DECHLORINATION
Design of Activated Carbon Adsorbers for Aqueous Chlorine Removal Based on the Mechanism of Removal,
W73-14804 5F

DECIDUOUS FORESTS
The Radiation and Energy Balances of Coniferous and Deciduous Forests,
W73-14870 2I

DECISION MAKING
Priority Ranking of Future Flood Control Investments,
W73-15045 6D

Interim Plan for Water Quality Management in the Denver Metropolitan Area-Addendum No 2.

W73-14866 5C

DIVERSION (STREAMS)

Method for Estimating the Diversion Potential of Streams in Eastern Massachusetts and Southern Rhode Island,
W73-14994 2E

DOMESTIC WASTES

Improvement of Hygienic Conditions by Organized Waste, (In German),
W73-15275 5D

DOMINANT ORGANISMS

Influence of Macro-Nutrients on the Relative Growth of Water Plants in the Qu'Appelle Lakes,
W73-15107 5C

DRAINAGE

Soil Bacteria in Land-Drainage Water,
W73-14823 5B

DRAINAGE SYSTEMS

Water Table Control with Subsurface Irrigation,
W73-14858 3F

An Inventory and Analysis of Existing Storm Drainage Systems in the Toledo Regional Area.
W73-15021 4A

DRAINAGE WATER

Soil Bacteria in Land-Drainage Water,
W73-14823 5B

DRIFTING (AQUATIC)

Prediction of Near-Surface Drift Currents From Wind Velocity,
W73-14834 2E

DROUGHT

The Effect of Drought, Irrigation and Mineral Fertilization on the Growth of the Root System of Soybean plants, (In Russian),
W73-15285 3F

DROUGHT TOLERANCE

Comparative Drought Resistance of Bos indicus and Bos taurus Crossbred Herds in Central Queensland. Relative Mortality Rates, Calf Birth Weights, and Weight Changes of Breeding Cows,
W73-15221 3F

DROUGHTS

Integrated Hydrologic and Societal Interactions to Floods and Droughts in India,
W73-15046 2E

Some Measures of Agricultural Drought,
W73-15064 3F

Generalized Hydrologic Modeling, A Key to Drought Analysis,
W73-15065 2G

A Methodology for Analysing Agricultural Drought,
W73-15066 3F

Simulation Model for the Decision Between Dilution or Sewage Treatment During Droughts,
W73-15067 5G

Use of Regional Economic Models in the Evaluation of Drought Impact,
W73-15068 6B

The Role of Weather Modification in Drought Relief,
W73-15069 3B

Regional Water Exchange System as an Alternative for Alleviating Drought Problems,
W73-15070 6B

Unpredictability of Hydrologic Droughts,
W73-15072 2B

Statistical Properties of Runs as Applied to Hydrologic Droughts,
W73-15075 2E

Droughts as Extreme Distributions from a Point Rainfall Process,
W73-15076 2B

DRY SEASONS

Comparative Drought Resistance of Bos indicus and Bos taurus Crossbred Herds in Central Queensland. Relative Mortality Rates, Calf Birth Weights, and Weight Changes of Breeding Cows,
W73-15221 3F

DUNALIELLA TERTIOLECTA

Sensitivity of Dunaliella and Scenedesmus (Chlorophyceae) to Chlorinated Hydrocarbons,
W73-15114 5C

DUPUIT-FORCHHEIMER THEORY

Validity of Dupuit-Forchheimer Equation,
W73-14844 2F

DYE CONCENTRATIONS

Removal of Dyes from Waste Waters (Udalenie krasitelei iz stochnykh vod),
W73-14948 5D

DYE RELEASES

New Fluorescent Tracer Detection Techniques for use in Polluted Environments,
W73-14770 5B

DYNAMIC PROGRAMMING

Multilake River System Operation Rules,
W73-14909 4A

Optimal Sequencing of Capacity Expansion Projects,
W73-14912 6A

E. COLI
The Effects of Differently Extracted Endotoxins from Escherichia Coli on Rainbow Trout (Salmo Gairdneri),
W73-14769 5C

EASEMENTS
Gibbs V. Wright (Action to Determine Right to Obtain Water from Spring),
W73-15160 6E

EAST AFRICAN RIFT LAKE SEDIMENTS
Data File on Metal Distribution in East African Rift Sediments,
W73-15262 2J

ECOLOGICAL DISTRIBUTION
Algae of the Cho-Oyu (E. Himalayas) Expedition-II, Bacillariophyceae-II,
W73-15094 5A

Influence of Macro-Nutrients on the Relative Growth of Water Plants in the Qu'Appelle Lakes,
W73-15107 5C

Abundance, Distribution and Oil Biodegradation Potential of Microorganisms in Raritan Bay,
W73-15108 5C

Wax Esters in Tropical Zooplankton and Nekton and the Geographical Distribution of Wax Esters in Marine Copepods,
W73-15117 5B

The Occurrence and Distribution of some Aquatic Phycomycetes on Ross Island and the Dry Valleys of Victoria Land, Antarctica,
W73-15120 5B

Comparison of Microhabitats of Macroscopic Subalpine Stream Algae,
W73-15125 5C

Toxicology of Pesticides: Recent Advances,
W73-15126 5C

Blue-Green Algal Flora of Rajasthan,
W73-15130 5C

ECONOMIC ANALYSIS
Water Planning Models in North Atlantic Study,
W73-14908 6D

ECONOMIC IMPACT
Use of Regional Economic Models in the Evaluation of Drought Impact,
W73-15068 6B

ECONOMICS
Feeders Scolded for Failing to Learn Their 'Manure Economics'.
W73-15173 5D

Interregional Competition in the Cattle Feeding Economy, with Special Emphasis on Economies of Size,
W73-15184 3F

ECOSYSTEMS
Dynamic Model of Water Movement in Soil Under Various Climatological Conditions,
W73-14972 5B

EDUCATION
A Computer-Implemented Instructional Game for Evaluating Water Management Alternatives,
W73-14772 6B

Applied Water Chemistry at Washington State University,
W73-14787 9A

EFFLUENTS
Some Facets of the Impact of Pulp Mill Effluent on the Alberni Inlet,
W73-14932 5B

Balance and Characteristics of Effluents from Recycling of Residual Fermentation Liquor (Balans i kharakteristika stochnykh vod pri vozvrate posledrozhzhevoi brazhki na gidroliz),
W73-14942 5D

Studies on the Food Chain Contamination by Tritium,
W73-14963 5B

Tritium in the Atmosphere and Ocean,
W73-14965 5B

Forced Exchange of Tritiated Water with Clays,
W73-14971 5B

Sources of Tritium and Its Behavior Upon Release to the Environment,
W73-15234 5B

ELECTRIC POWER
Practical Decision Rules in Reservoir Operation,
W73-15044 4A

ELECTRIC POWERPLANTS
The Effect of Thermal Inputs on the Populations of Fish and Macroinvertebrates in the Wabash River,
W73-14869 5C

ELECTRODES
Ion Selective Flow-Through Electrodes: Construction and Properties of Heavy Metal Sensors,
W73-15170 5A

ELECTROLYSIS
Method for Purification and Disinfection of Surface Waters by Means of Low-Frequency Alternating Current (Metoda Pentru Epurarea si Dezinfectarea Apelor de Suprafata cu Ajutorul Curentului Alternativ de Joasa Frecvent a),
W73-14957 5F

ELECTRON ACCEPTOR
The Detection of a Bound Ferredoxin in the Photosynthetic Lamellae of Blue-Green Algae and other Oxygen Evolving Photosynthetic Organisms,
W73-14882 5C

ELECTRON MICROSCOPY
Light and Electron Microscope Studies of Diatom Species Belonging to the Genus Chaetoceros Ehrenberg. I. Chaetoceros Septentrionale Oestrup,
W73-15113 5A

EMBRYONIC DEVELOPMENT
Yolk-Sac Malformation in Pacific Salmon in Relation to Substrate, Temperature, and Water Velocity,
W73-15102 5C

EMERSON DISPERSION TEST
The Emerson Dispersion Test and Its Relationship to Hydraulic Conductivity,
W73-15222 2G

EMULSIFIERS
Growth and Toxicity Tests on the Marine Nanoplanktonic Alga Platymonas Tetrathele G.S. West in the Presence of Crude Oil and Emulsifiers,
W73-15106 5C

ENDORHEIC LAKES
Aspects of the Recovery of a Saline African Lake Following A Dry Period,
W73-15296 2H

ENDOTOXIN
The Effects of Differently Extracted Endotoxins from Escherichia Coli on Rainbow Trout (Salmo Gairdneri),
W73-14769 5C

ENERGY BALANCE
The Radiation and Energy Balances of Coniferous and Deciduous Forests,
W73-14870 2I

ENERGY BUDGET
Effects of Development on Salinity and Limnology of the Lower Colorado River,
W73-14756 5C

ENGLAND
Utilisation of Disused Coal Mines as Water Storage Reservoirs,
W73-14827 4B

Experiments in Tracing Underground Waters in Limestones,
W73-14830 2F

ENTERIC VIRUS
Health Considerations in Renovating Waste Water for Domestic Use,
W73-15027 5D

ENTRAINMENT
Turbulent Entrainment in Buoyant Jets and Plumes,
W73-14841 5B

Vulnerability and Survival of Young Connecticut River Fish Entrained at a Nuclear Power Plant,
W73-15100 5C

ENVIRONMENT
Biokinetics of Environmental Tritium,
W73-14962 5B

Studies on the Food Chain Contamination by Tritium,
W73-14963 5B

ENVIRONMENTAL EFFECTS
Variation of Urban Runoff Quality with Duration and Intensity of Storms--Phase II,
W73-14771 4C

The Ecology of the Southern California Bight: Implications for Water Quality Management.
W73-14914 5C

Man and the Environment, A Bibliography of Selected Publications of the United Nations System, 1946-1971.
W73-14974 5C

Final Environmental Statement Related to Operation of Enrico Fermi Atomic Power Plant - Unit 2.
W73-14979 5B

Final Environmental Statement Related to Operation of Duane Arnold Energy Center.
W73-14980 5B

Days Creek Lake Project, SOUTH Umpqua River, Douglas County, Oregon, (Final Environmental Statement).
W73-15017 4A

Behavior of the Planktonic Coelenterates, Sarsia Tubulosa, Phialidium Gregarium, and Pleurobrachia Pileus in Salinity Discontinuity Layers,
W73-15098 5C

Yolk-Sac Malformation in Pacific Salmon in Relation to Substrate, Temperature, and Water Velocity,
W73-15102 5C

Columbia River Thermal Effects Study: Reactor Effluent Problems,
W73-15118 5C

Comparison of Microhabitats of Macroscopic Subalpine Stream Algae,
W73-15125 5C

Gillham Lake, Cossatot River, Arkansas, Appendix 1, Correspondence (Final Environmental Impact Statement).
W73-15137 4A

Gillham Lake, Cossatot River, Arkansas, Appendix IV, Appendix V, Appendix VI (Final Environmental Impact Statement).
W73-15138 4A

Environmental Defense Fund, Inc. V. Armstrong (Action by Environmental Protection Groups Against Commissioner of Bureau of Reclamation and Others for Injunctive Relief with Respect to the Proposed New Melones Dam).
W73-15146 6E

Stream Channelization (A Critique of CEQ'S Channelization Report),
W73-15147 6E

Ririe Dam and Lake, Willow Creek, Idaho (Final Environmental Impact Statement).
W73-15162 4A

Maritime Provinces Water Resources Study, Stage 1, Vol 1, Summary.
W73-15202 6D

Final Environmental Statement Related to Operation of Virgil C. Summer Nuclear Station Unit 1.
W73-15235 5B

Final Environmental Statement Related to Operation of Quad-Cities Nuclear Power Station Units 1 and 2.
W73-15236 5B

Final Environmental Statement Related to Operation of Cooper Nuclear Station.
W73-15237 5B

Considerations in the Assessment of the Consequences of Effluents from Mixed Oxide Fuel Fabrication Plants. Environmental Considerations Affecting Consequences of Releases,
W73-15241 5B

Final Environmental Statement Related to Operation of Turkey Point Plant, Units 3 and 4.
W73-15243 5B

Final Environmental Statement Related to the Prairie Island Nuclear Generating Plant.
W73-15256 5C

ENVIRONMENTAL IMPACT STATEMENT

Gillham Lake, Cossatot River, Arkansas, Appendix 1, Correspondence (Final Environmental Impact Statement).
W73-15137 4A

ENVIRONMENTAL IMPACT STATEMENTS

Final Environmental Statement Related to Operation of Enrico Fermi Atomic Power Plant - Unit 2.
W73-14979 5B

Final Environmental Statement Related to Operation of Duane Arnold Energy Center.
W73-14980 5B

Days Creek Lake Project, SOUTH Umpqua River, Douglas County, Oregon, (Final Environmental Statement).
W73-15017 4A

Gillham Lake, Cossatot River, Arkansas, Appendix IV, Appendix V, Appendix VI (Final Environmental Impact Statement).

Ririe Dam and Lake, Willow Creek, Idaho (Final Environmental Impact Statement).
W73-15162 4A

Construction of Mooring Facilities, Ohio River Navigation System (Final Environmental Statement).
W73-15168 8A

Final Environmental Statement Related to Operation of Virgil C. Summer Nuclear Station Unit 1.
W73-15235 5B

Final Environmental Statement Related to Operation of Quad-Cities Nuclear Power Station Units 1 and 2.
W73-15236 5B

Final Environmental Statement Related to Operation of Cooper Nuclear Station.
W73-15237 5B

Final Environmental Statement Related to the Prairie Island Nuclear Generating Plant.
W73-15256 5C

EQUILIBRIUM MODELS

Equilibrium Concepts in Natural Water Systems.
W73-15190 2K

EQUIPMENT

Energy and Flow Requirements for Chopping Water Hyacinths,
W73-14759 4A

ERAMOSA RIVER

Microdistribution and Feeding of the Net-Spinning Caddisflies (Trichoptera) of a Canadian Stream,
W73-15104 5B

EROSION

Stream Channelization (A Critique of CEQ'S Channelization Report),
W73-15147 6E

EROSION CONTROL

Introduced Animal Effects and Erosion Phenomena in the Northern Urewera Forests,
W73-15291 4D

ERROR SOURCES

Unreliability of the C-14 Method for Estimating Primary Productivity in Eutrophic Dutch Coastal Waters,
W73-15078 5A

ERTS

Suspended Sediment Observations from ERTS-1,
W73-15002 2L

ESTANCIA VALLEY (N MEX)

Quantitative Hydrologic Study of a Closed Basin with a Playa (Estancia Valley, New Mexico),
W73-14767 2A

ESTERS

Wax Esters in Tropical Zooplankton and Nekton and the Geographical Distribution of Wax Esters in Marine Copepods,
W73-15117 5B

ESTUARIES

Salt-Water Movement in the Lower Withlacoochee River--Cross-Florida Barge Canal Complex,
W73-14808 8B

Suspended Sediment Transport From the Gironde Estuary (France) Onto the Adjacent Continental Shelf,
W73-14813 2L

Minimum Length of Salt Intrusion in Estuaries,
W73-14842 2L

A Numerical Model of Estuarine Pollutant Transport,
W73-14900 5B

Distribution, Transport, and Composition of Suspended Matter in the St. Lawrence Estuary,
W73-15004 2L

A Bill to Authorize the Establishment of the Florida Frontier Historic Riverway.
W73-15151 6E

ESTUARINE ENVIRONMENT

Ecological Implications of Fallout Radioactivity Accumulated by Estuarine Fishes and Mollusks,
W73-14961 5B

Radiocesium Distribution in Water, Sediment, and Biota in the Hudson River Estuary from 1964 through 1970,
W73-15247 5B

Amchitka Radiobiological Program Progress Report for March 1972 to December 1972,
W73-15255 5B

EUTROPHICATION

Effects of Development on Salinity and Limnology of the Lower Colorado River,
W73-14756 5C

Eutrophication of Sheltered Bays in a Large Lake,
W73-14875 5C

A Study of Toxicity and Biostimulation in San Francisco Bay-Delta Waters, Volume I, Summary Report,
W73-14876 5C

A Study of Toxicity and Biostimulation in San Francisco Bay-Delta Waters, Volume VI, Bioassays of Lower Trophic Levels,
W73-14879 5C

EUTROPHICATION

A Study of Toxicity and Biostimulation in San Francisco Bay-Delta Waters, Volume VIII, Algal Assays of Selected Waste Discharges,
W73-14881 5C

Effects of Nutrient Enrichment and a Rough Fish Population (Carp) on a Game Fish Population (Smallmouth Bass),
W73-14885 5C

Control of Reservoir Eutrophication,
W73-14886 5G

Eutrophication Control: Nutrient Inactivation by Chemical Precipitation at Horseshoe Lake, Wisconsin,
W73-14889 5G

Problems in the Study and Regulation of Anthropogenic Eutrophication of Water Bodies in the USSR (Zadachi izucheniya i regulirovaniya antropogennogo yevtrofirovaniya vodoyemov v SSR),
W73-15012 5C

Growth, Gas Vacuolation and Buoyancy in a Natural Population of a Plantonic Blue-Green Alga,
W73-15022 5C

Use of the Heterotrophic Activity Technique as a Measure of Eutrophication,
W73-15110 5C

Limnology of Some Madison Lakes: Annual Cycles,
W73-15287 5C

Occurrence of Microorganisms of Decomposing Organic Phosphorus Compounds in 2 Types of Bottom Sediments of the Eutrophic Lake Jeziorak,
W73-15293 5C

Aquatic Macrophytes as Limnological Indicators,
W73-15298 5C

EVALUATION

Evaluating Federal Water Projects: A Critique of Proposed Standards,
W73-14926 6A

EVAPORATION

Plant Moisture Status Effects in Estimation of Evaporation by a Combination Method,
W73-15223 2D

EVAPORATION CONTROL

Modeling and Simulation of Reservoirs to Predict Evaporation Reduction by Surface Films,
W73-14868 3B

EVAPORATION MODELING

Modeling and Simulation of Reservoirs to Predict Evaporation Reduction by Surface Films,
W73-14868 3B

EVAPORATORS

Origin of Toxic Materials in the Kraft Pulping Process,
W73-14931 5B

EVAPOTRANSPIRATION

Application of the Grid Square Technique to Mapping of Evapotranspiration,
W73-14824 2D

Irrigation Canal System Capacity Design Criteria,
W73-14906 3F

Soil Water Content Beneath Summer-Dormant and Summer-Active Swards in a Seasonally Semi-Arid Environment,

FEDERAL GOVERNMENT COST-BENEFIT ANALYSIS

Evaluating Federal Water Projects: A Critique of Proposed Standards,
W73-14926 6A

FEDERAL WATER POLLUTION CONTROL ACT

A Bill to Amend the Federal Water Pollution Control Act by Establishing Standards for Synthetic Detergents.
W73-15150 6E

FEED LOTS

Nebraska is No. One.
W73-15171 5B

Cattle Feedlots and the Environment.
W73-15175 5D

Facility Design,
W73-15176 5D

Principles of Feedlot Odor Control.
W73-15181 5B

Climate and the Selection of a Beef Waste Management System,
W73-15183 5D

Interregional Competition in the Cattle Feeding Economy, with Special Emphasis on Economies of Size,
W73-15184 3F

Animal Waste Disposal and Control of Feedlot Runoff.
W73-15231 5D

FEEDLOTS

Feeders Scolded for Failing to Learn Their 'Manure Economics'.
W73-15173 5D

FERMENTATION

Balance and Characteristics of Effluents from Recycling of Residual Fermentation Liquor (Balans i kharakteristika stochnykh vod pri vozvrate posledrozhzhevoi brazhki na gidroliz),
W73-14942 5D

Techniques for the Sampling and Handling of Anacrobic Microbes in Waste Fermentation Systems,
W73-15172 5A

FERTILIZATION
Effects of Nutrient Enrichment and a Rough Fish Population (Carp) on a Game Fish Population (Smallmouth Bass),
W73-14885 5C

FERTILIZER
Feeders Scolded for Failing to Learn Their 'Manure Economics'.
W73-15173 5D

FERTILIZERS
Nitrogen in Industry,
W73-15186 5D

FETUS
Exposure of Dogfish Shark Feti to Mercury,
W73-15088 5C

FILTERS
Use of Mixed Media in Water Plant Filtration,
W73-14924 5D

FILTRATION
Filter Press, More Particularly for Dewatering Sludge in Sewage Treatment Plants,
W73-14779 5D

Use of Mixed Media in Water Plant Filtration,
W73-14924 5D

Metropolitan District Water Supply System, Hartford, Connecticut: Design Features of the Water Treatment Plant at Reservoir Six,
W73-15206 5F

FINANCING
Financing Alternatives for Regional Resource Development,
W73-14861 6B

FISH
Water Quality Criteria for European Freshwater Fish. Report on Monohydric Phenols and Inland Fisheries,
W73-15086 5C

Feeding Rates and Food Utilization of Stream Caddisfly Larvae of the Genus Neophylax (Trichoptera:Limnephilidae) Using Cobalt-60 and Carbon-14,
W73-15252 5B

FISH BEHAVIOR
Cover Response of Fish in Bioassay of Acid Water,
W73-14901 5C

Behavior of Tritium in Fish Following Chronic Exposure,
W73-14964 5C

Effects of Exposure to Sublethal DDT on the Exploratory Behavior of Goldfish (Carassium auratus),
W73-15085 5C

Temperature Selection of Atlantic Salmon (Salmo Salar) and Brook Trout (Salvelinus Fontinalis) as Influenced by Various Chlorinated Hydrocarbons,
W73-15097 5C

FISH CONTROL AGENTS
Toxicity of TFM (Lampricide) to Six Early Life Stages of Rainbow Trout (Salmo gairdneri),
W73-15096 5C

FISH DIETS
The Acute Toxicity of a Yellow Phosphorus Contaminated Diet to Brook Trout (Salvelinus Fontinalis),
W73-15093 5C

FISH FARMING
Residues of Mirex in Channel Catfish and Other Aquatic Organisms,
W73-15091 5C

FISH GUIDING
An Application of Louver Deflectors for Guiding Atlantic salmon (Salmo salar) Smolts from Power Turbines,
W73-14927 8I

FISH MIGRATION
The Effect of Thermal Inputs on the Populations of Fish and Macroinvertebrates in the Wabash River,
W73-14869 5C

FISH PHYSIOLOGY
Some Physiological Aspects of Sublethal Heat Stress in the Juvenile Steelhead Trout (Salmo gairdneri) and Coho Salmon (Oncorhynchus Kisutch),
W73-15121 5C

FISH POPULATIONS
The Effect of Thermal Inputs on the Populations of Fish and Macroinvertebrates in the Wabash River,
W73-14869 5C

Effects of Nutrient Enrichment and a Rough Fish Population (Carp) on a Game Fish Population (Smallmouth Bass),
W73-14885 5C

Effects of Acid Mine Drainage on Fish Populations,
W73-14902 5C

The Population Dynamics of Channel Catfish, Ictalurus punctatus (Rafinesque), in the Little Missouri Arm of Lake Sakakawea. Before and During Commercial Exploitation, 1968-1971,
W73-15261 5C

FISH REPRODUCTION
Effect on Lime Neutralized Iron Hydroxide Suspensions on Survival, Growth, and Reproduction of the Fathead Minnow (Pimephales Promelas),
W73-15099 5C

FISHING
Participation and Expenditures for Hunting, Fishing and General Rural Outdoor Recreation in Arizona,
W73-15225 6B

FISHWAY
Correlations Between Alewife Activity and Environmental Variables at a Fishway,
W73-15297 8I

FLAME PHOTOMETRY
Determination of Trace Quantities of Arsenic in Wastewaters by Carbon Rod Atomic Absorption Spectrometry,
W73-14786 5A

FLAVONOIDS
Preliminary Chemical Studies of Aquatic Plants from Minnesota,
W73-15229 2H

FLOOD CONTROL
Flood Control in Reservoirs and Storage Pounds,

Log-Pearson Type III and Gumbel Analyses of Floods,
W73-15049 2E

Best Fitting of Probability Functions to a Set of Data for Flood Studies,
W73-15050 2E

Reliability of Estimates of the Exceedence Probability of a Given Flood Magnitude,
W73-15051 2E

A New Proposal for Computation of Flood Frequency,
W73-15052 2E

FLOOD PLAINS
The Use of Near-Infrared Photography in the Analysis of Surface Morphology of an Argentine Alluvial Floodplain,
W73-15003 2E

FLOOD PROBABILITY
Significance of the Genesis of Floods on Probability Analysis,
W73-15062 2E

FLOOD PROTECTION
Summary of a Report to the Santa Clara County Flood Control and Water District on the Baylands Salt Water Flood Control Planning Study.
W73-15020 4A

FLOOD ROUTING
Flood Control in Reservoirs and Storage Pounds,
W73-14832 4A

Watershed Flood Routing Using Distributed Parameters,
W73-15059 2E

Model for Calculating Floods in Urbanized Watersheds,
W73-15060 4C

FLOOD WAVES
Subcritical Kinematic Flow in a Stable Stream,
W73-14839 2E

Aquifer Diffusivity of the Ohio River Alluvial Aquifer by the Flood-Wave Response Method,
W73-14991 2F

FLOODS
Changes in Floodflow Characteristics of a Rectified Channel Caused by Vegetation, Jackson, Mississippi,
W73-14995 2E

An Inventory and Analysis of Existing Storm Drainage Systems in the Toledo Regional Area
W73-15021 4A

Integrated Hydrologic and Societal Interactions to Floods and Droughts in India,
W73-15046 2I

A Modified Monte Carlo Technique to Solve Groundwater Movement as Affected by Flood Stages,
W73-15055 2I

Analysis of Risks and Uncertainties in Flood Control,
W73-15056 4A

Significance of the Genesis of Floods on Probability Analysis,
W73-15062 2E

Flood Characteristics of the Ramu River, New Guinea,
W73-15063 2E

FLORIDA
Marginal Values of Water Used in the Irrigation of Citrus in the Central Ridge Section of Florida,
W73-14760 3F

River Basin Simulation as a Means of Determining Operating Policy for a Water Control System,
W73-14761 6B

Geohydrology of the Cross-Florida Barge Canal Area with Special Reference to the Ocala Vicinity,
W73-14807 8B

Salt-Water Movement in the Lower Withlacoochee River--Cross-Florida Barge Canal Complex,
W73-14808 8B

Ground-Water Conditions in the Lower Withlacoochee River--Cross-Florida Barge Canal Comples Area,
W73-14809 8B

History and Sand Budgets of the Barrier Island System in the Panama City, Florida, Region,
W73-14818 2L

Appraisal of the Water Resources of Charlotte County, Florida,
W73-14996 4B

A Bill to Authorize the Establishment of the Florida Frontier Historic Riverway.
W73-15151 6E

Florida Courts and Water Pollution: A Floating Crap Game.
W73-15152 6E

A Zonal Leaf Spot of Waterhyacinth Caused by Cephalosporium Zonatum,
W73-15226 5C

Aphanomyces Blight of Amazon Sword Plants,
W73-15227 5C

Hydrologic Data for 1971, Broward County, Florida,
W73-15266 4B

FLOW AUGMENTATION
Simulation Model for the Decision Between Dilution or Sewage Treatment During Droughts,
W73-15067 5G

FLOW NETS
Watershed Flood Routing Using Distributed Parameters
W73-15059 2E

FLUCTUATIONS
Patterns of Variability of River Runoff as a Basis for a Theory of its Regulation and Use (Zakonomernosti kolebaniy rechnogo stoka kak osnova teorii yego regulirovaniya i ispolzovaniya)
W73-15010 4A

FLUORESCENCE TRACERS
New Fluorescent Tracer Detection Techniques for use in Polluted Environments
W73-14770 5B

FLUORIDATION
Monitoring the Dose of Fluorine in Fluoridation of Drinking Water (In Russian)
W73-15089 5A

FLUORINE
Monitoring the Dose of Fluorine in Fluoridation of Drinking Water (In Russian)
W73-15089 5A

FLUVIAL SEDIMENTS
Basic Patterns in Movement of Fluvial Sediments (Osnovnyye zakonomernosti dvizheniya rechnykh nanosov),
W73-14850 2J

FOOD CHAINS
The Dose to Man via Food-Chain Transfer Resulting from Exposure to Tritiated Water Vapor,
W73-14967 5C

Indirect Radioactive Contamination of the Food Chain Determination of The Factors of Transfer, Soil/Agricultural Produce, Soil/Milk, in the European Community,
W73-14984 5B

Assimilation and Retention of ZN65 by the Mallard Duck (Anas Platyrhynchus),
W73-15248 5B

Uptake and Retention of Tungsten-181 by Crayfish (Cambarus longulus longerostris Ort.),
W73-15250 5B

Feeding Rates and Food Utilization of Stream Caddisfly Larvae of the Genus Neophylax (Trichoptera:Limnephilidae) Using Cobalt-60 and Carbon-14,
W73-15252 5B

FORAGE GRASSES
Salt Tolerance and Cation Interaction in Alkali Sacaton at Germination.
W73-15215 3C

FORAGE LEGUMES
Influence of Irrigation on the Yield and Persistence of Forage Legumes,
W73-15295 3F

FORAGES
Vegetation Changes as a Result of Soil Ripping on the Rio Puerco in New Mexico.
W73-15213 4D

FORECASTING
Water Resources and Utilization (Voda--resursy i potrebleniye),
W73-14846 6B

Characteristics of the Hydrologic Cycle in the Atmosphere and Possibilities of A Long-Term

Forecast of Changes (Zakonomernosti vlagooborota v atmosfere i vozmozhnosti dolgosrochnogo predskazaniya yego izmeneniy),
W73-14848 2B

Unpredictability of Hydrologic Droughts,
W73-15072 2B

FOREIGN RESEARCH
Problems in the Study and Regulation of Anthropogenic Eutrophication of Water Bodies in the USSR (Zadachi izucheniya i regulirovaniya antropogennogo yevtrofirovaniya vodoyemov v SSR),
W73-15012 5C

FOREST SOILS
Deforestation Effects on Soil Moisture, Streamflow, and Water Balance in the Central Appalachians,
W73-14919 4D

FORFICATOCARIS
Brazilian Ground Water Crustacea: 1. Studies on the Genera Parastenocaris Kessler and Forficatocaris Jakobi from Serra Do Mar of Sao Paulo (Copepoda, Harpacticoidea), (In German),
W73-15277 2I

FRACTURE DESIGN CHARTS
A Rapid Method of Predicting Width and Extent of Hydraulically Induced Fractures,
W73-15194 8G

FRACTURE DIMENSIONS
A Rapid Method of Predicting Width and Extent of Hydraulically Induced Fractures,
W73-15194 8G

FRACTURE PERMEABILITY
A Rapid Method of Predicting Width and Extent of Hydraulically Induced Fractures,
W73-15194 8G

FRACTURES (GEOLOGIC)
A Rapid Method of Predicting Width and Extent of Hydraulically Induced Fractures,
W73-15194 8G

FRANCE (BAUPTE)
Purification of Waste Waters by Means of Aerated Lagoons (L'epuration des eaux residuaires par lagunage aere),
W73-14916 5D

FRANCE (GIRONDE ESTUARY)
Suspended Sediment Transport From the Gironde Estuary (France) Onto the Adjacent Continental Shelf,
W73-14813 2L

FRANCE (RHONE RIVER)
Role of Organic Materials in a Water Course with Respect to Radioactive Contamination. Method of Extraction, Fractionation and Identification by Spectroscopy and Their Affinity to Radionuclides,
W73-14982 5B

FREEZING
A Study of the Freezing Cycle in an Alaskan Stream,
W73-14754 2C

FRESHWATER
Conference on the Hydrologic Cycle in Nature and Its Role in Formation of Freshwater Resources (Soveshchaniye po probleme 'Vlagooborot v prirode i yego rol' v formirovanii resursov presnykh vod'),
W73-15013 2A

FUEL REPROCESSING
Tritium in the Atmosphere and Ocean,
W73-14965 5B

FUNGI
The Ecology of Soil-Borne Pathogens,
W73-15281 5B

GAME ANIMALS
Impacts of Water-Resource Development in the Snake River Area on Wildlife,
W73-14773 6G

GAMMA DISTRIBUTIONS
A Note on the Generation of Gamma Random Variables with Non-Integral Shape Parameter,
W73-15071 7C

GAMMA RAYS
Field Spectrometric Measurements of Radionuclide Concentrations and External Gamma Exposure Rates at the Nevada Test Site, A Demonstration Study,
W73-15238 5B

GAS VACUOLATION
Growth, Gas Vacuolation and Buoyancy in a Natural Population of a Plantonic Blue-Green Alga,
W73-15022 5C

GEOCHEMISTRY
Equilibrium Concepts in Natural Water Systems.
W73-15190 2K

GEOMORPHOLOGY
The Influence of Slope Orientation Upon the Soil Moisture Regime, and Its Hydrogeomorphological Significance,
W73-14831 2G

GEORGIA
A Plan for Water and Sewer, (Chatham County - Savannah).
W73-15199 5G

GERMANY
Flood Control Policies Developed by Simulation,
W73-15047 4A

Model for Calculating Floods in Urbanized Watersheds,
W73-15060 4C

GERMANY (KIEL BAY)
On the Origin of the Whiting (Merlangius Merlangus (L.) in Kiel Bay, (In German),
W73-15278 2L

GERMANY (RHINE REGION)
Successions of Planktonic Organisms in Ground Water Recharge Basins Fed by River Water,
W73-15290 5G

GERMINATION
Salt Tolerance and Cation Interaction in Alkali Sacaton at Germination,
W73-15215 3C

GOLDFISH
Effects of Exposure to Sublethal DDT on the Exploratory Behavior of Goldfish (Carassium auratus),
W73-15085 5C

GOLDSTREAM CREEK (ALAS)
The Significance of Selected Physical and Chemical Variables in Benthic Macroinvertebrate Distribution in a Small Subarctic Stream,
W73-14865 5C

The Drift of Benthic Invertebrates in Goldstream Creek, Alaska,
W73-14866 5C

An Investigation of Selected Physical and Chemical Characteristics of Two Subarctic Streams,
W73-14867 5B

GOVERNMENT FINANCE
An Inventory and Analysis of Existing Storm Drainage Systems in the Toledo Regional Area.
W73-15021 4A

GRADEX METHOD
Application of the Method of Gradex,
W73-15033 2E

GRAND TRAVERSE BAY (LAKE MICHIGAN)
Distribution and Levels of Lead and Arsenic in Grand Traverse Bay, Lake Michigan Bottom Sediments,
W73-14781 5B

GRANTS
Applied Water Chemistry at Washington State University,
W73-14787 9A

The Federal Coastal Zone Management Act of 1972,
W73-15148 6E

GRASSES
Tumbleweed and Cheatgrass Uptake of Transuranium Elements Applied to Soil as Organic Acid Complexes,
W73-14975 5B

Tritium Uptake and Loss in Grass Vegetation When Exposed to an Atmospheric Source of Tritiated Water,
W73-14976 5B

GRAVEL PACK IMPLACEMENT
Sizing Gravel-Pack-Liner Slots in Oil and Gas Wells,
W73-15192 8G

GRAVEL SIZING
Sizing Gravel-Pack-Liner Slots in Oil and Gas Wells,
W73-15192 8G

GRAVELS
Pebble Segregation and Bed Lenticularity in Wave-Worked Versus Alluvial Gravel,
W73-15263 2J

GRAVITY FLOW
Preliminary Sewer Study, Vredenburgh, Alabama,
W73-15204 5D

GREAT BRITAIN
Treatment and Disposal of Industrial Wastewaters,
W73-15205 5D

Pollution of Water,
W73-15207 5D

GREAT LAKES
Report on the Water Levels of the Great Lakes.
W73-15165 6E

GREAT LAKES BASIN
The Great Lakes Basin: Alternative Institutional Arrangements for Multi-Purpose Resources Management,
W73-15203 6E

GREEN BAY (WIS)
Water Quality Perception and the Recreational Uses of Green Bay, Lake Michigan,
W73-15024 5G

GREENLAND
Mercury in the Greenland Ice Sheet: Further Data,
W73-14925 5B

GREY SEALS
Mercury in Seals from Eastern Canada,
W73-15123 5B

GROUNDWATER
The Effects of Diminished Groundwater Supplies on Selected New Hampshire Industries,
W73-14766 4B

Study of Groundwater Resources in the USSR (Izucheniye resursov podzemnykh vod SSSR),
W73-14849 4B

Changes in Foreshore Sand Volume on a Tidal Beach: Role of Fluctuations in Water Table and Ocean Still-Water Level,
W73-14988 2F

Appraisal of the Water Resources of Charlotte County, Florida,
W73-14996 4B

Use of Ground Water for Irrigation in Seward County, Nebraska in 1971,
W73-14997 4B

Fundamental Problems of Groundwater Conservation (Osnovnyye problemy okhrany podzemnykh vod),
W73-15009 5B

Drinkwine V. State of Vermont (Suit to Restrain State from Operation of Pumps and Drilled Wells Located on its Property).
W73-15161 6E

GROUNDWATER FLOW
Quantitative Hydrologic Study of a Closed Basin with a Playa (Estancia Valley, New Mexico),
W73-14767 2A

GROUNDWATER MOVEMENT
The Effect of Sorption on the Migration of Be-7 From a High Energy Accelerator Constructed on a Chalk Site,
W73-14821 5B

Experiments in Tracing Underground Waters in Limestones,
W73-14830 2F

Validity of Dupuit-Forchheimer Equation,
W73-14844 2F

Water Quality and Mineral Solubilities in Surface and Ground Water; Oak Openings Community, Lucas Co., Ohio,
W73-14863 4B

Aquifer Diffusivity of the Ohio River Alluvial Aquifer by the Flood-Wave Response Method,
W73-14991 2F

A Modified Monte Carlo Technique to Solve Groundwater Movement as Affected by Flood Stages,
W73-15055 2F

GROUNDWATER RESOURCES
Study of Groundwater Resources in the USSR (Izucheniye resursov podzemnykh vod SSSR),
W73-14849 4B

GROWTH RATES
Nitrate Reductase Activity During a Dinoflagellate Bloom,
W73-15083 5C

Growth Temperature Requirements and Lower Lethal Temperatures for Juvenile Smallmouth Bass (Micropterus Dolomieui),
W73-15101 5C

Growth of Dictyosphaerium, Selenastrum, and Scenedesmus (Chlorophyceae) in a Dilute Algal Medium,
W73-15116 5C

Effects of Brief Temperature Increases on Larvae of the American Oyster (Crassostrea Virginica),
W73-15124 5C

Biodegradation of Oleates,
W73-15127 5B

Growth and Cell-Size Distribution of Marine Planktonic Algae in Batch and Dialysis Cultures,
W73-15128 5C

The Population Dynamics of Channel Catfish, Ictalurus punctatus (Rafinesque), in the Little Missouri Arm of Lake Sakakawea. Before and During Commercial Exploitation, 1968-1971,
W73-15261 5C

GROWTH STAGES
Toxicity of TFM (Lampricide) to Six Early Life Stages of Rainbow Trout (Salmo gairdneri),
W73-15096 5C

GULF OF GUINEA
Suspended Matter in Surface Waters of the Eastern Gulf of Guinea,
W73-14817 2L

GULF OF ST. LAWRENCE
Phytoplankton Organization in Baie Des Chaleurs (Gulf of St Lawrence),
W73-15111 2L

GUPPY
Beryllum Uptake by the Common Guppy Using Radioisotope Be-7. I. Preliminary Study: Tracer Mechanics and Procedures,
W73-15135 5C

Beryllium Uptake by the Common Guppy Using Radioisotope Be-7. II. Beryllium Concentration in Fish,
W73-15136 5C

HALOPLEGMA ANWERII
Morphology and Development of a New Alga, Haloplegma Anwerii (Ceramiaceae) from Karachi Coast,
W73-15133 5A

HANDBOOKS
Handbook of Chlorination for Potable Water, Wastewater, Cooling Water, Industrial Processes, and Swimming Pools,
W73-14915 5F

HARBOR SEALS
Mercury in Seals from Eastern Canada,
W73-15123 5B

HARBORS
Eutrophication of Sheltered Bays in a Large Lake
W73-14875 5C

Deep Water Port Policy Issues
W73-15163 6I

HARDWOOD
On Spent Semichemical Pulping Liquors (I) Species Variation of Pulping Timbers Color and Chemical Oxygen Demand. (In Japanese)
W73-15189 5B

HARP SEALS
Mercury in Seals from Eastern Canada
W73-15123 5B

HARTFORD (CONN)
Metropolitan District Water Supply System, Hartford, Connecticut: Design Features of the Water Treatment Plant at Reservoir Six.
W73-15206 5F

HARVESTING
The Effects of Harvesting Aquatic Macrophytes on Algae,
W73-14888 5C

HARVESTING (AQUATIC WEEDS)
Energy and Flow Requirements for Chopping Water Hyacinths,
W73-14759 4A

HARVESTORS (MACHINERY)
Energy and Flow Requirements for Chopping Water Hyacinths,
W73-14759 4A

HEAT RESISTANCE
Growth Temperature Requirements and Lower Lethal Temperatures for Juvenile Smallmouth Bass (Micropterus Dolomieui),
W73-15101 5C

HEAVY METALS
Investigation of Heavy Metal-Sludge Complexation constants by Cation Exchange,
W73-14783 5B

HELMINTH
Study of the Helminth Fauna of Domestic Animals in Area of Danube Power Station: III. Helminth Fauna of Water Fowls in Zitny Ostrov (Czechoslovakia). (In Czech),
W73-15280 2I

HEPATIC AMOEBIASIS
Hepatic Amoebiasis in Ceylon,
W73-14897 5C

HERBICIDES
Differential Responses of Marine Phytoplankton to Herbicides: Oxygen Evolution,
W73-14883 5C

Synergism of Insecticides by Herbicides,
W73-15112 5C

HETEROTROPHY
Use of the Heterotrophic Activity Technique as a Measure of Eutrophication,
W73-15110 5C

HOGS
Inclined-Plane Trickling Filter for Swine Waste,
W73-15179 5D

Equipment and Facilities for Modern Methods of Swine Manure Disposal,
W73-15180 5D

HOOD SEALS
Mercury in Seals from Eastern Canada,
W73-15123 5B

HORSESHOE LAKE (WIS.)
Eutrophication Control: Nutrient Inactivation by Chemical Precipitation at Horseshoe Lake, Wisconsin,
W73-14889 5G

HOUSTON SHIP CHANNEL (TEX)
Mercury Pollution and Enforcement of the Refuse Act of 1899 (Part 3).
W73-15167 5G

HUDSON RIVER
Radiocesium Distribution in Water, Sediment, and Biota in the Hudson River Estuary from 1964 through 1970,
W73-15247 5B

HUMAN DISEASES
Chlorinated Urban Water: A Cause of Dialysis-Induced Hemolytic Anemia,
W73-14928 5F

HUMAN PATHOLOGY
Toxicology of Pesticides: Recent Advances,
W73-15126 5C

HUNTING
Participation and Expenditures for Hunting, Fishing and General Rural Outdoor Recreation in Arizona,
W73-15225 6B

HYDRAULIC CONDUCTIVITY
The Emerson Dispersion Test and Its Relationship to Hydraulic Conductivity,
W73-15222 2G

HYDRAULIC FRACTURES
A Rapid Method of Predicting Width and Extent of Hydraulically Induced Fractures,
W73-15194 8G

HYDRAULIC JUMP
Plane Jet on Sloping Floors Under Finite Submergence,
W73-14840 8B

HYDRAULIC STRUCTURES
Soviet National Committee of the International Association for Hydraulic Research (Sovetskiy natsional'nyy komitet Mezhdunarodnoy assotsiatsii po gidravlicheskim issledovaniyam),
W73-15014 2A

HYDRAULICS
Soviet National Committee of the International Association for Hydraulic Research (Sovetskiy natsional'nyy komitet Mezhdunarodnoy assotsiatsii po gidravlicheskim issledovaniyam),
W73-15014 2A

HYDROBIONTS
Contamination of Water Bodies and Biological Assessment of Water Quality (Zagryazneniye vodoyemov i biologicheskaya otsenka kachestva vod),
W73-15007 5C

HYDROELECTRIC POWER
Planning the Development of the Nestos River,
W73-14907 4A

Tarbela Dam Project, Pakistan,
W73-15211 8A

HYDROGEN
The Behavior of Tritium in the Soil,
W73-14970 5B

HYDROGEN ION CONCENTRATION
Cover Response of Fish in Bioassay of Acid Water,
W73-14901 5C

Effects of Acid Mine Drainage on Fish Populations,
W73-14902 5C

Acute Toxicity of Low pH to Aquatic Insects,
W73-14903 5C

HYDROGEN SULFIDE
Chemical Ecology of Hydrogen Sulfide Production in Freshwater Lake Sediment,
W73-14782 2H

HYDROGEOLOGY
Geohydrology of the Cross-Florida Barge Canal Area with Special Reference to the Ocala Vicinity,
W73-14807 8B

A Pattern of Muskeg--A Key to Continental Water,
W73-15005 2C

HYDROGRAPH ANALYSIS
Analysis of Unitgraph Method of Flood Synthesis by Shallow Water Equations,
W73-15038 2A

Removal of Unit Hydrograph Oscillations by Filtering,
W73-15040 2E

Long Term Runoff Analysis by a Conceptual Physical Model,
W73-15042 2A

HYDROIDS
Shallow Water Hydroids of the Delaware Bay Region,
W73-14819 2L

HYDROLOGIC ASPECTS
Hydrologic Data for 1971, Broward County, Florida,
W73-15266 4B

HYDROLOGIC CYCLE
Calculation of Items in the Water Balance of the Atmosphere and Hydrosphere (O raschete elementov vodnogo balansa atmosfery i gidrosfery),
W73-14847 2A

Characteristics of the Hydrologic Cycle in the Atmosphere and Possibilities of A Long-Term Forecast of Changes (Zakonomernosti vlagooborota v atmosfere i vozmozhnosti dolgosrochnogo predskazaniya yego izmeneniy),
W73-14848 2B

Conference on the Hydrologic Cycle in Nature and Its Role in Formation of Freshwater Resources (Soveshchaniye po probleme 'Vlagooborot v prirode i yego rol' v formirovanii resursov presnykh vod'),
W73-15013 2A

HYDROLOGIC DATA
Objective Regionalization of Peak Flow Rates,
W73-15057 2E

Theoretical Studies on Gamma-Type Distribution and Runs--Their Applications to Hydrology,
W73-15077 7C

Hydrologic Data for 1971, Broward County, Florida,
W73-15266 4B

HYDROLOGIC SYSTEMS
Analysis of Multiple-Input Stochastic Hydrologic Systems,
W73-14753 2A

HYDROLOGY
Analysis of Multiple-Input Stochastic Hydrologic Systems,
W73-14753 2A

Ground-Water Conditions in the Lower Withlacoochee River--Cross-Florida Barge Canal Comples Area,
W73-14809 8B

International Cooperation in Hydrology (Mezhdunarodnoye sotrudnichestvo v oblasti gidrologii),
W73-14855 6E

Fourth All-Union Hydrology Congress (IV Vsesoyuznyy gidrologicheskiy s'yezd),
W73-15015 2A

HYDROLYSIS
In Vitro Hydroloysis of Polyoxyethylene Esters by Tissues of The American Eel and Atlantic Salmon,
W73-15087 5B

HYDROLYSIS INDUSTRY
Balance and Characteristics of Effluents from Recycling of Residual Fermentation Liquor (Balans i kharakteristika stochnykh vod pri vozvrate posledrozhzhevoi brazhki na gidroliz),
W73-14942 5D

HYDROSPHERE
Calculation of Items in the Water Balance of the Atmosphere and Hydrosphere (O raschete elementov vodnogo balansa atmosfery i gidrosfery),
W73-14847 2A

HYPOLIMNION
Bottom Withdrawal of Viscous Stratified Fluid,
W73-14837 4A

HYPOTHALMIC TEMPERATURE
Hypothalamic Temperature Regulation in Cattle,
W73-15174 5B

HYPOTHALMUS
Hypothalamic Temperature Regulation in Cattle,
W73-15174 5B

ICE COVER
A Study of the Freezing Cycle in an Alaskan Stream,
W73-14754 2C

Method and Means for the Water Transport of Liquids,
W73-14780 5G

Effects of Thermal Discharges Upon the Chena River,
W73-14864 5C

Mercury in the Greenland Ice Sheet: Further Data,
W73-14925 5B

An in Situ Method for Measuring Primary Productivity of Arctic Sea Ice Algae,
W73-15122 5A

ICE FOG
Effects of Thermal Discharges Upon the Chena River,
W73-14864 5C

IDAHO
Ririe Dam and Lake, Willow Creek, Idaho (Final Environmental Impact Statement).
W73-15162 4A

IDEAL SOIL MODEL
Wettability as Related to Capillary Action in Porous Media,
W73-15195 8D

ILLINOIS
Analysis of Multiple-Input Stochastic Hydrologic Systems,
W73-14753 2A

Final Environmental Statement Related to Operation of Quad-Cities Nuclear Power Station Units 1 and 2.
W73-15236 5B

IMBIBITION
Wettability as Related to Capillary Action in Porous Media,
W73-15195 8D

IMPERIAL VALLEY
Solid Set Sprinkler Irrigation,
W73-15224 3F

INCINERATION
Program Attacks Land, Water, Air Pollution.
W73-14936 5D

INCOME ANALYSIS
Public Investment Criteria for Water Oriented Recreation in the Lake Erie Basin,
W73-14774 6D

INDIA
Integrated Hydrologic and Societal Interactions to Floods and Droughts in India,
W73-15046 2E

Flood Control Planning with Inadequate Hydrologic Data,
W73-15048 4A

Dew Over India and Its Contribution to Winter-Crop Water Balance,
W73-15220 3F

A National Water Grid for India.
W73-15270 4A

INDIA (RAJASTHAN)
Blue-Green Algal Flora of Rajasthan,
W73-15130 5C

INDIAN OCEAN
Deep-Sea Zeolites: Variations in Space and Time in the Sediments of the Indian Ocean,
W73-15269 2J

INDIANA
Effects of Sanitary Landfills on Ground and Surface-Water Movement and Water Quality,
W73-14859 5B

The Effect of Thermal Inputs on the Populations of Fish and Macroinvertebrates in the Wabash River,
W73-14869 5C

INDUS RIVER
Tarbela Dam Project, Pakistan,
W73-15211 8A

INDUSTRIAL POLLUTION
Ohio Warranto to Enforce a Corporate Duty Not to Pollute the Environment.
W73-15155 5G

INDUSTRIAL WASTES
Disposal of Sugar Refinery Lagoon Effluents by Soil Spreading.
W73-14755 5D

A Study of Toxicity and Biostimulation in San Francisco Bay Delta Waters. Volume III. Acute Toxicity of Discharged Wastes.
W73-14878 5C

White Water Reuse on a Fine Paper Machine.
W73-14920 5D

A General Perspective Concerning the Cost of Pollution Abatement at any Specified Level.
W73-14921 5D

The 'Savo' Method Treats Industrial Process Water.
W73-14933 5D

Balance and Characteristics of Effluents from Recycling of Residual Fermentation Liquor (Balans i kharakteristika stochnykh vod pri vozvrate posledrozhzhevoi brazhki na gidrolizy).
W73-14942 5D

Removal of Dyes from Waste Waters (Udalenie krasitelei iz stochnykh vod).
W73-14948 5D

A Study of the Distribution of Polychlorinated Biphenyls in the Aquatic Environment,
W73-14992 5B

Should Industry Purchase or Seek its Own Supply of Water,
W73-15026 3E

Nitrogen in Industry,
W73-15186 5D

Treatment and Disposal of Industrial Wastewaters,
W73-15205 5D

Considerations in the Assessment of the Consequences of Effluents from Mixed Oxide Fuel Fabrication Plants. Environmental Considerations Affecting Consequences of Releases,
W73-15241 5B

INDUSTRIAL WATER
Use of Mixed Media in Water Plant Filtration.
W73-14924 5D

Should Industry Purchase or Seek its Own Supply of Water,
W73-15026 3E

INFILTRATION
Rainfall Excess Model from Soil Water Flow Theory,
W73-14836 2G

Predictive Study on Urbanizing Effect of Drainage Basin on Flood Runoff,
W73-15061 4C

INFRARED RADIATION
The Use of Near-Infrared Photography in the Analysis of Surface Morphology of an Argentine Alluvial Floodplain,
W73-15003 2E

INHIBITORS
Life History and Growth Inhibition Studies in Platydorina caudata (Volvocaceae).
W73-14899 5C

INJECTION WELLS
Geologic Appraisal of Paradox Basin Salt Deposits for waste Emplacement
W73-14820 5B

INJUNCTIVE RELIEF
Gillham Lake Cossatot River Arkansas: Appendix IV Appendix V Appendix VI (Final Environmental Impact Statement)
W73-15138 4A

INLAND WATERWAYS
Geohydrology of the Cross Florida Barge Canal Area with Special Reference to the Ocala Vicinity.
W73-14807 8B

Ground Water Conditions in the Lower Withlacoochee River Cross Florida Barge Canal Complex Area
W73-14809 8B

INNOVATION
Factors Affecting Innovation in Water Quality Management Implementation of the 1968 Michigan Clean Water Bond Issue.
W73-14871 5G

INPUT-OUTPUT ANALYSIS
Social/Environmental Systems for Regional Development Planning.
W73-14860 6B

INSECTICIDES
Synergism of Insecticides by Herbicides.
W73-15112 5C

INSTITUTIONAL CONSTRAINTS
Mathematical Modeling of Urban Water Management Strategies,
W73-14757 6B

Legal Constraints on Urban Water Systems.
W73-14905 3D

The Great Lakes Basin: Alternative Institutional Arrangements for Multi-Purpose Resources Management.
W73-15203 6E

INSTRUMENTATION
Observations of Shallow Layering Utilizing the Pingerprobe Echo-Sounding System.
W73-14812 2J

Environmental Monitoring Helps Resolve Pollution Problems.
W73-14917 5A

Tritium Control Technology.
W73-14978 5G

Instrumentation for Measurement of Beach Water-Table Fluctuations.
W73-14986 2F

Ion Selective Flow-Through Electrodes: Construction and Properties of Heavy Metal Sensors.
W73-15170 5A

INTER-BASIN TRANSFERS
A National Water Grid for India.
W73-15270 4A

A Survey of Long-Term Water Requirements in Japan.
W73-15272 6D

INTERFACIAL TENSION
Wettability as Related to Capillary Action in Porous Media,
W73-15195 8D

INTERNATIONAL HYDROLOGICAL DECADE
International Cooperation in Hydrology (Mezhdunarodnoye sotrudnichestvo v oblasti gidrologii),
W73-14855 6E

INVERTEBRATES
The Effect of Thermal Inputs on the Populations of Fish and Macroinvertebrates in the Wabash River,
W73-14869 5C

INVESTMENT
Public Investment Criteria for Water Oriented Recreation in the Lake Erie Basin,
W73-14774 6D

Financing Alternatives for Regional Resource Development,
W73-14861 6B

IODINE
The Comparative Mode of Action of Chlorine, Bromine, and Iodine on F2 Bacterial Virus,
W73-14792 5D

Bromine Disinfection of Waste Water Effluents,
W73-14793 5D

Wastewater Disinfection of Trickling Filter Effluent with Bromine and Chlorine,
W73-14794 5D

Bromine, Chlorine, and Iodine Compared as Disinfectants for Amoebic Cysts,
W73-14795 5D

Experimental Uptake and Chemical Fractionation of Iodine-131 and Iron-59 in a Turtle Grass (Thalassia testudinum) BED,
W73-15253 5B

IODINE RADIOISOTOPES
Experimental Uptake and Chemical Fractionation of Iodine-131 and Iron-59 in a Turtle Grass (Thalassia testudinum) BED,
W73-15253 5B

ION
Limnological Studies in an African Swamp: Seasonal and Spatial Changes in the Swamps of Lake Chilwa, Malawi,
W73-15289 2H

IOWA
Final Environmental Statement Related to Operation of Duane Arnold Energy Center.
W73-14980 5B

IRAN (KHUZESTAN)
Irrigation Canal System Capacity Design Criteria,
W73-14906 3F

IRELAND
Some Effects of Soil Water Tables on the Growth of Sitka Spruce in Northern Ireland,
W73-14898 2I

IRIDIUM RADIOISOTOPES
Comparison of Radioactive Glasses of Scandium and Iridium as Tracers in Sediment-Transport Studies,
W73-14826 2J

IRON
Iron, Manganese, Cobalt, and Zinc Cycles in a South Carolina Reservoir,
W73-15251 5B

Experimental Uptake and Chemical Fractionation of Iodine-131 and Iron-59 in a Turtle Grass (Thalassia testudinum) BED,
W73-15253 5B

IRON COMPOUNDS
Effect on Lime Neutralized Iron Hydroxide Suspensions on Survival, Growth, and Reproduction of the Fathead Minnow (Pimephales Promelas),
W73-15099 5C

Controlling Iron and Copper Deposits in Modern High-Pressure Boilers,
W73-15187 5F

IRON HYDROXIDE
Effect on Lime Neutralized Iron Hydroxide Suspensions on Survival, Growth, and Reproduction of the Fathead Minnow (Pimephales Promelas),
W73-15099 5C

IRRIGATION
Use of Ground Water for Irrigation in Seward County, Nebraska in 1971,
W73-14997 4B

Influence of Irrigation on Overwinter Survival of the Pink Bollworm,
W73-15185 3F

Rice Cultivation in Southern Kazakhstan Kzylkumsky Ridge, (In Russian),
W73-15283 3F

Influence of Irrigation on the Yield and Persistence of Forage Legumes,
W73-15295 3F

IRRIGATION DESIGN
Water Table Control with Subsurface Irrigation,
W73-14858 3F

IRRIGATION OPERATION AND MAINTENANCE
Automated Irrigation is Here,
W73-15212 3F

IRRIGATION PRACTICES
Irrigation Canal System Capacity Design Criteria,
W73-14906 3F

Solid Set Sprinkler Irrigation,
W73-15224 3F

IRRIGATION WELLS
Use of Ground Water for Irrigation in Seward County, Nebraska in 1971,
W73-14997 4B

ISOLATION
The Occurrence and Distribution of some Aquatic Phycomycetes on Ross Island and the Dry Valleys of Victoria Land, Antarctica,
W73-15120 5B

Microfungi Colonizing Submerged Standing Culms of Phragmites Communis Trin,
W73-15131 5C

Microfungi Colonizing Collapsed Aerial Parts of Phragmites Communis Trin. in Water,
W73-15132 5C

ISOTOPE-ZEEMAN ATOMIC ABSORPTION PHOTOMETRY
The Izaa Sprectrometer: A Detector for Trace Elements in Gases, Liquids, and Soils,
W73-14785 2K

ISRAEL (TEL-AVIV)
Health Considerations in Renovating Waste Water for Domestic Use,
W73-15027 5D

ITALY
Best Fitting of Probability Functions to a Set of Data for Flood Studies,
W73-15050 2E

JAPAN
Oji (Paper Co.), Kasugai Mill Positively Grappling With Environmental Problem,
W73-14958 5D

Predictive Study on Urbanizing Effect of Drainage Basin on Flood Runoff,
W73-15061 4C

A Survey of Long-Term Water Requirements in Japan.
W73-15272 6D

JAPAN (YODO RIVER BASIN)
Stochastic Structures in Space and Time of Daily Precipitation and Their Simulation,
W73-15074 2E

JETS
Plane Jet on Sloping Floors Under Finite Submergence,
W73-14840 8B

Turbulent Entrainment in Buoyant Jets and Plumes,
W73-14841 5B

Effects of Thermal Discharges Upon the Chena River,
W73-14864 5C

JUDICIAL DECISIONS
State V. General Motors Corporation (Prosecution of Corporation for Violation of State Statute Proscribing Pollution of State Water).
W73-15145 6E

Lerro V. Thomas Wynne, Inc. (Action by Property Owners Through Whose Property Creek Flowed and Who were Affected by Presence of Fuel Oil in the Creek).
W73-15157 6E

Conservationist's Standing to Challenge the Actions of Federal Agencies,
W73-15158 6E

Gibbs V. Wright (Action to Determine Right to Obtain Water from Spring),
W73-15160 6E

JUVENILE FISH
Oral Toxicity of Chlorinated Dibenzofurans to Juvenile Atlantic Salmon,
W73-15092 5C

Temperature Selection of Atlantic Salmon (Salmo Salar) and Brook Trout (Salvelinus Fontinalis) as Influenced by Various Chlorinated Hydrocarbons,
W73-15097 5C

Growth Temperature Requirements and Lower Lethal Temperatures for Juvenile Smallmouth Bass (Micropterus Dolomieui),
W73-15101 5C

JUVENILE FISH

Some Physiological Aspects of Sublethal Heat Stress in the Juvenile Steelhead Trout (Salmo gairdneri) and Coho Salmon (Oncorhynchus Kisutch),
W73-15121 5C

KAM RIVER (ONTARIO)
Great Lakes Paper External Feedwater System for High-Pressure Boilers,
W73-14930 5F

KANSAS CITY (MO)
Water and Sewerage Development Plan, Kansas City Metropolitan Region
W73-15198 5G

KARST HYDROLOGY
Experiments in Tracing Underground Waters in Limestones,
W73-14830 2F

KENNEBEC RIVER (MAINE)
The Bath Story - New Kennebec River Subaqueous Water Main,
W73-15025 8A

KINEMATIC WAVES
Predictive Study on Urbanizing Effect of Drainage Basin on Flood Runoff,
W73-15061 4C

LA JOLLA SUBMARINE CANYON (CALIF)
Storm-Generated Current in La Jolla Submarine Canyon, California,
W73-15268 2E

LABORATORIES
Nebraska is No. One.
W73-15171 5B

LABORATORY TESTS
Effects of Exposure to Sublethal DDT on the Exploratory Behavior of Goldfish (Carassium auratus),
W73-15085 5C

Effect on Lime Neutralized Iron Hydroxide Suspensions on Survival, Growth, and Reproduction of the Fathead Minnow (Pimephales Promelas),
W73-15099 5C

Some Physiological Aspects of Sublethal Heat Stress in the Juvenile Steelhead Trout (Salmo gairdneri) and Coho Salmon (Oncorhynchus Kisutch),
W73-15121 5C

LAGOONS
Evaluations of Stream Pollution and Trace Substances in the New Lead Belt of Missouri,
W73-14857 5B

LAKE BASINS
The Aral Sea Problem (Problema Aral'skogo morya),
W73-14852 4A

LAKE ERIE
Public Investment Criteria for Water Oriented Recreation in the Lake Erie Basin,
W73-14774 6D

Mercury Concentrations in Sediments of the Lake Erie Basin, Ohio.
W73-15260 5B

LAKE ERIE TRIBUTARIES
Mercury Concentrations in Sediments of the Lake Eric Basin, Ohio.
W73-15260 5B

LAKE HEFNER (ARIZ)
Modeling and Simulation of Reservoirs to Predict Evaporation Reduction by Surface Films.
W73-14868 5B

LAKE MENDOTA (WIS.)
The Effects of Harvesting Aquatic Macrophytes on Algae.
W73-14888 5C

Major Cause of Algae and Weeds in Lake Mendota,
W73-14895 5C

LAKE MICHIGAN
Distribution and Levels of Lead and Arsenic in Grand Traverse Bay, Lake Michigan Bottom Sediments,
W73-14781 5B

Plutonium in Lake Michigan Water,
W73-14977 5B

Water Quality Perception and the Recreational Uses of Green Bay, Lake Michigan,
W73-15024 5G

Report on the Water Levels of the Great Lakes.
W73-15165 6E

Great Lakes Radioecology,
W73-15239 5B

The Use of Natural and Fallout Radionuclides to Measure Recent Sedimentation Rates in Southern Lake Michigan,
W73-15240 5B

Radiological and Environmental Research Division Annual Report,
W73-15246 5B

LAKE ONTARIO
Remote Sensing of Turbidity Plumes in Lake Ontario,
W73-14993 2H

LAKE SEDIMENTS
Phosphate Retention by Lake Sediments,
W73-14751 5B

Data File on Metal Distribution in East African Rift Sediments,
W73-15262 2J

LAKE WINNEBAGO (WIS)
Kinetics of Orthophosphate Uptake by Phytoplankton Populations in Lake Winnebago,
W73-14918 5C

LAKES
Chemical Ecology of Hydrogen Sulfide Production in Freshwater Lake Sediment,
W73-14782 2H

The Aral Sea Problem (Problema Aral'skogo morya),
W73-14852 4A

Eutrophication of Sheltered Bays in a Large Lake,
W73-14875 5C

Multilake River System Operation Rules,
W73-14909 4A

Problems in the Study and Regulation of Anthropogenic Eutrophication of Water Bodies in the USSR (Zadachi izucheniya i regulirovaniya antropogennogo yevtrofirovaniya vodoyemov v SSR),
W73-15012 5C

LAMPRICIDES
Toxicity of TFM (Lampricide) to Six Early Life Stages of Rainbow Trout (Salmo gairdneri)
W73-15096 5C

LAND RECLAMATION
Water Balance Studies and Calculations in Regulation of the Moisture Regime of Excessively Wet Reclaimed Soils (Vodnobalansovyye issledovaniya i raschety pri regulirovanii rezhima uvlazhneniya meliorirovannykh iz bytovchno-uvlazhnennykh zemel),
W73-15011 2G

LAND SUBSIDENCE
Summary of a Report to the Santa Clara County Flood Control and Water District on the Baylands Salt Water Flood Control Planning Study
W73-15020 4A

LAND TENURE
Irrigation Canal System Capacity Design Criteria.
W73-14906 3F

LAND USE
Irrigation Canal System Capacity Design Criteria.
W73-14906 3F

LANDFILLS
Effects of Sanitary Landfills on Ground and Surface-Water Movement and Water Quality.
W73-14859 5B

LAPLACES EQUATION
Seepage Into Sheet Pile Cofferdam.
W73-14843 8B

LARVAE
Effects of Brief Temperature Increases on Larvae of the American Oyster (Crassostrea Virginica).
W73-15124 5C

LASERS
Statistical Comparison of Airborne Laser and Stereophotogrammetric Sea Ice Profiles.
W73-14999 2C

LEAD
Evaluations of Stream Pollution and Trace Substances in the New Lead Belt of Missouri.
W73-14857 5B

Ion Selective Flow-Through Electrodes: Construction and Properties of Heavy Metal Sensors.
W73-15170 5A

LEAF EPIDERMAL
Interactions of Potassium Chloride and Two Antitranspirants on Stomatal Regulation in Isolated Leaf Epidermal Strips of Tephrosia purpurea Pers,
W73-15284 2D

LEBISTES RETRICULATUS
Beryllium Uptake by the Common Guppy Using Radioisotope Be-7. II. Beryllium Concentration in Fish,
W73-15136 5C

LEGAL ASPECTS
Meandering Rights for Contracted Water,
W73-15143 6E

State V. General Motors Corporation (Prosecution of Corporation for Violation of State Statute Proscribing Pollution of State Water).
W73-15145 6E

Environmental Defense Fund, Inc. V. Armstrong (Action by Environmental Protection Groups Against Commissioner of Bureau of Reclamation and Others for Injunctive Relief with Respect to the Proposed New Melones Dam).
W73-15146 6E

Quo Warranto to Enforce a Corporate Duty Not to Pollute the Environment,
W73-15155 5G

Taking Versus Reasonable Regulation: A Reappraisal in Light of Regional Planning and Wetlands,
W73-15156 6E

Conservationist's Standing to Challenge the Actions of Federal Agencies,
W73-15158 6E

Town of Salem V. County of Kenosha (Suit to Determine Constitutionality of Shorelands and Floodlands Ordinance).
W73-15159 6E

LEGISLATION
Protection of Water Bodies in the USSR from Pollution (Okhrana vodoyemov v SSSR ot zagryazneniya),
W73-14853 5G

Control of Water Resources Quality: Administrative Aspects,
W73-15028 5G

The Federal Coastal Zone Management Act of 1972,
W73-15148 6E

A Bill to Amend the Federal Water Pollution Control Act by Establishing Standards for Synthetic Detergents.
W73-15150 6E

Deep Water Port Policy Issues.
W73-15163 6E

New Commitment for Cleaner Water,
W73-15164 5G

LENINGRAD
New and Rare Aquatic Fungal Species Isolated from Stock Ponds in the Leningrad Region, (In Russian),
W73-14887 5C

LETHAL LIMIT
The Acute Toxicity of a Yellow Phosphorus Contaminated Diet to Brook Trout (Salvelinus Fontinalis),
W73-15093 5C

LEVEES
Summary of a Report to the Santa Clara County Flood Control and Water District on the Baylands Salt Water Flood Control Planning Study.
W73-15020 4A

LICHENS
Soil Surface Lichens in Arid and Subarid Southeastern Australia. III: The Relationship Between Distribution and Environment,
W73-15258 2G

LIFE CYCLES
Microdistribution and Feeding of the Net-Spinning Caddisflies (Trichoptera) of a Canadian Stream,
W73-15104 5B

LIFE HISTORY STUDIES
Life History and Growth Inhibition Studies in Platydorina caudata (Volvocaceae),
W73-14899 5C

LIGHT INTENSITY
The Light Dependence of Nitrate Reductase in Marine Phytoplankton,
W73-15082 5B

LIGNINS
A Study of Renovation of Pulp Mill Waste Water: Adsorption Characteristics of Kraft Pulp Lignin on Activated Carbon, (In Japanese),
W73-14941 5D

LIMITING FACTORS
The Light Dependence of Nitrate Reductase in Marine Phytoplankton,
W73-15082 5B

LINCOLN SEA
Statistical Comparison of Airborne Laser and Stereophotogrammetric Sea Ice Profiles,
W73-14999 2C

LINEAR PROGRAMMING
Economic Models of Industrial Pollution Control in Regional Planning,
W73-14904 5G

LITTER
Productivity of an Arid Zone Shrub (Eremophila gilesii) Community in South-Western Queensland,
W73-15219 2I

LITTLE MISSOURI RIVER (N. DAK)
The Population Dynamics of Channel Catfish, Ictalurus punctatus (Rafinesque), in the Little Missouri Arm of Lake Sakakawea. Before and During Commercial Exploitation, 1968-1971,
W73-15261 5C

LOBSTERS
Sublethal Effects of Crude Oil on Lobster, (Homarus americanus) Behavior,
W73-14894 5C

Comparison of the Metabolism of Parathion by Lobsters and Rats,
W73-15090 5C

LONGHURST-HARDY PLANKTON RECORDER
Sampling Bias of a Longhurst-Hardy Plankton Recorder,
W73-15080 7B

LOUISIANA
Remote Measurement of Salinity in an Estuarine Environment,
W73-15001 2L

LUBBOCK (TEX)
Variation of Urban Runoff Quality with Duration and Intensity of Storms--Phase II,
W73-14771 4C

MACROINVERTEBRATES
Seasonal Fluctuations of Aquatic Macroinvertebrates in Oakwood Bottoms Greentree Reservoir,
W73-15209 5C

MACROPHYTES
Influence of Macro-Nutrients on the Relative Growth of Water Plants in the Qu'Appelle Lakes,
W73-15107 5C

Aquatic Macrophytes as Limnological Indicators,
W73-15298 5C

MAINE
Phosphate Retention by Lake Sediments,
W73-14751 5B

Annual Report of Activities During Fiscal Year 1973.
W73-14752 9D

The Bath Story - New Kennebec River Subaqueous Water Main,
W73-15025 8A

MALAWI (LAKE CHILWA)
Limnological Studies in an African Swamp: Seasonal and Spatial Changes in the Swamps of Lake Chilwa, Malawi,
W73-15289 2H

Aspects of the Recovery of a Saline African Lake Following A Dry Period,
W73-15296 2H

MALLARD DUCK
Assimilation and Retention of ZN65 by the Mallard Duck (Anas Platyrhynchus),
W73-15248 5B

MANAGEMENT
Factors Affecting Innovation in Water Quality Management: Implementation of the 1968 Michigan Clean Water Bond Issue,
W73-14871 5G

Interim Plan for Water Quality Management in the Denver Metropolitan Area-Addendum No 2.
W73-15201 5G

MANGANESE
Similarities Between MN, NI and CO Contents of Deep-Sea Clays and Manganese Nodules From the South-West Region of the North Atlantic,
W73-14816 2J

Iron, Manganese, Cobalt, and Zinc Cycles in a South Carolina Reservoir,
W73-15251 5B

MANGANESE NODULES
Similarities Between MN, NI and CO Contents of Deep-Sea Clays and Manganese Nodules From the South-West Region of the North Atlantic,
W73-14816 2J

MANNINGS EQUATION
Changes in Floodflow Characteristics of a Rectified Channel Caused by Vegetation, Jackson, Mississippi,
W73-14995 2E

MAPPING
Mapping Hydrocarbon Seepages in Water-Covered Regions,
W73-14776 5G

Application of the Grid Square Technique to Mapping of Evapotranspiration,
W73-14824 2D

The Use of Near-Infrared Photography in the Analysis of Surface Morphology of an Argentine Alluvial Floodplain,
W73-15003 2E

MARGINAL COSTS
Marginal Values of Water Used in the Irrigation of Citrus in the Central Ridge Section of Florida,
W73-14760 3F

MARINE ALGAE
Differential Responses of Marine Phytoplankton to Herbicides. Oxygen Evolution,
W73-14883 5C

Phosphorus Flux Across A Coral Reef,
W73-14892 5B

Purification of Waste Waters by Means of Aerated Lagoons (L'epuration des eaux residuaires par lagunage aere),
W73-14916 5D

An in Situ Method for Measuring Primary Productivity of Arctic Sea Ice Algae,
W73-15122 5A

Growth and Cell-Size Distribution of Marine Planktonic Algae in Batch and Dialysis Cultures,
W73-15128 5C

Morphology and Development of a New Alga, Haloplegma Anwerii (Ceramiaceae) from Karachi Coast,
W73-15133 5A

MARINE ANIMALS
Ecological Implications of Fallout Radioactivity Accumulated by Estuarine Fishes and Mollusks,
W73-14961 5B

MARINE GEOLOGY
Marine Geology of the Aleutian Abyssal Plain,
W73-14811 2J

MARINE MICROORGANISMS
Abundance, Distribution and Oil Biodegradation Potential of Microorganisms in Raritan Bay,
W73-15108 5C

MARINE PLANTS
Experimental Uptake and Chemical Fractionation of Iodine-131 and Iron-59 in a Turtle Grass (Thalassia testudinum) BED,
W73-15253 5B

MARITIME PROVINCES (CANADA)
Maritime Provinces Water Resources Study, Stage 1, Vol 1, Summary.
W73-15202 6D

MARYLAND
Water Resources of the Delmarva Peninsula, A Summary Report to the Congress,
W73-15000 4B

MASON BOG (CALIF)
Invertebrate Movements and Some Diel and Seasonal Changes in A Sierra Nevada Peatland,
W73-15105 5C

MASSACHUSETTS
Method for Estimating the Diversion Potential of Streams in Eastern Massachusetts and Southern Rhode Island,
W73-14994 2E

MATHEMATIC STUDIES
Equilibrium Concepts in Natural Water Systems.
W73-15190 2K

MATHEMATICAL MODEL
The Dose to Man via Food Chain Transfer Resulting from Exposure to Tritiated Water Vapor,
W73-14967 5C

MATHEMATICAL MODELS
Mathematical Modeling of Urban Water Management Strategies.
W73-14757 6B

Simulation of the Quantity and Quality of Flow in a River Basin,
W73-14765 2A

A Numerical Model of Estuarine Pollutant Transport,
W73-14900 5B

Water Planning Models in North Atlantic Study,
W73-14908 6D

A General Perspective Concerning the Cost of Pollution Abatement at any Specified Level,
W73-14921 5D

The Role of Lag in a Quasi Linear Analysis of the Surface Runoff System,
W73-15037 2A

Demonstration of Nonlinear Effects of a Second Order Surface Runoff Model by Field Data,
W73-15039 2A

Long Term Runoff Analysis by a Conceptual Physical Model,
W73-15042 2A

Generalized Hydrologic Modeling, A Key to Drought Analysis,
W73-15065 2G

A Methodology for Analysing Agricultural Drought,
W73-15066 3F

Use of Regional Economic Models in the Evaluation of Drought Impact,
W73-15068 6B

Turnover of Zn65 in Oysters,
W73-15254 5C

MATHEMATICAL STUDIES
Atmospheric Reaeration in Natural Streams,
W73-14896 5B

MAYFLIES
The Significance of Selected Physical and Chemical Variables in Benthic Macroinvertebrate Distribution in a Small Subarctic Stream,
W73-14865 5C

The Drift of Benthic Invertebrates in Goldstream Creek, Alaska,
W73-14866 5C

MEANDERS
Theories and Relationships of River Channel Patterns,
W73-14833 2E

MEASUREMENT
Design and Control of Transient Waste Treatment Processes,
W73-14762 5D

Tritium in the Atmosphere and Ocean,
W73-14965 5B

Guidance for Limiting Environmental Releases of Tritium,
W73-14968 5B

Catchability of the C-14 Method for Estimating Primary Productivity in Eutrophic Dutch Coastal Waters,
W73-15078 5A

Use of the Heterotrophic Activity Technique as a Measure of Eutrophication,
W73-15110 5C

Using Odor Intensity Limits in Air Quality Standards,
W73-15178 5G

MECHANICAL EQUIPMENT
Simple Apparatus for Conducting Acute Toxicity Bioassays Under Field Conditions,
W73-15084 5A

MEDITERRANEAN SEA
Precipitation and Lithification of Magnesian Calcite in the Deep Sea Sediments of the Eastern Mediterranean Sea,
W73-15265 2J

No Current Reversal at 10,000 B.P. In the Strait of Gibraltar,
W73-15273 2J

MELT WATER
Hydrographical Data from 2 Soft Water Lakes with Special Reference to Precipitation (Melt Water),
W73-15299 2H

MEMBRANE FILTERS
Semi-Continuous Culture of Bacteria on Membrane Filters: I. Use for the Bioassay of Inorganic and Organic Nutrients in Aquatic Environments,
W73-14891 5B

MERCURY
Mercury in the Greenland Ice Sheet: Further Data,
W73-14925 5B

Mercury Concentrations in Dated Varved Marine Sediments Collected Off Southern California,
W73-14937 5B

Exposure of Dogfish Shark Feti to Mercury,
W73-15088 5C

Mercury in Seals from Eastern Canada,
W73-15123 5B

Mercury Pollution and Enforcement of the Refuse Act of 1899 (Part 3).
W73-15167 5G

Mercury Concentrations in Sediments of the Lake Erie Basin, Ohio.
W73-15260 5B

METABOLISM
Salinity, Plant Growth, and Metabolism,
W73-15218 3C

METALS
Spectrophotometric Determination of Vanadium in Sea Water,
W73-14950 5A

A Neutron Activation Procedure for the Determination of Dissolved Silver in Sea Water,
W73-14951 5A

Data File on Metal Distribution in East African Rift Sediments,
W73-15262 2J

METHANE
Transfer of Tritium from Methane to Vegetation,
W73-14969 5B

METHODOLOGY
A Rapid Method for Clearing Diatoms From Taxonomic and Ecological Studies,
W73-15115 5A

An in Situ Method for Measuring Primary Productivity of Arctic Sea Ice Algae,
W73-15122 5A

Beryllum Uptake by the Common Guppy Using Radioisotope Be-7. I. Preliminary Study: Tracer Mechanics and Procedures,
W73-15135 5C

MEXICO CITY (MEXICO)
Practical Decision Rules in Reservoir Operation,
W73-15044 4A

MICHIGAN
Chemical Ecology of Hydrogen Sulfide Production in Freshwater Lake Sediment,
W73-14782 2H

Muskegon Sprays Sewage Effluents on Land,
W73-14884 5D

Final Environmental Statement Related to Operation of Enrico Fermi Atomic Power Plant - Unit 2.
W73-14979 5B

MICHIGAN 1968 CLEAN WATER BOND ISSUE
Factors Affecting Innovation in Water Quality Management: Implementation of the 1968 Michigan Clean Water Bond Issue,
W73-14871 5G

MICRO CLIMATES
Some Observations on Soils-Microclimate Interactions,
W73-15292 2G

MICROBIAL DEGRADATION
Abundance, Distribution and Oil Biodegradation Potential of Microorganisms in Raritan Bay,
W73-15108 5C

Biodegradation of Oleates,
W73-15127 5B

MICROBIAL GROWTH
Techniques for the Sampling and Handling of Anaerobic Microbes in Waste Fermentation Systems,
W73-15172 5A

MICROENVIRONMENT
Dew Over India and Its Contribution to Winter-Crop Water Balance,
W73-15220 3F

Soil Surface Lichens in Arid and Subarid Southeastern Australia. III: The Relationship Between Distribution and Environment,
W73-15258 2G

MICROORGANISMS
Bromine, Chlorine, and Iodine Compared as Disinfectants for Amoebic Cysts,
W73-14795 5D

MILWAUKEE RIVER (WIS)
Simulation in Watershed Planning,
W73-14910 4A

MINE DRAINAGE
Simulation and Optimization of Acid Mine Drainage Abatement Alternatives,
W73-14913 5G

MINE WATER
Evaluations of Stream Pollution and Trace Substances in the New Lead Belt of Missouri,
W73-14857 5B

MINERAL WATER
Water Quality and Mineral Solubilities in Surface and Ground Water; Oak Openings Community, Lucas Co., Ohio,
W73-14863 4B

MINERALS
The Effect of Drought, Irrigation and Mineral Fertilization on the Growth of the Root System of Soybean plants, (In Russian),
W73-15285 3F

MINNESOTA
Climatological Notes of 1972 - Minnesota,
W73-14763 2B

Alleviation of Lake Pollution by Utilization of Aquatic Plants for Nutritional, Medicinal or Industrial Purposes,
W73-14764 5A

Simulation of the Quantity and Quality of Flow in a River Basin,
W73-14765 2A

Financing Alternatives for Regional Resource Development,
W73-14861 6B

Directory of Water Resources Research Faculty at University of Minnesota and State and Private Colleges in Minnesota,
W73-14862 6A

Ninth Annual Report Water Resources Research Center.
W73-14872 9D

Walton V. St. Clair: The Standing Question,
W73-15154 6E

Antimicrobial Effects of Aquatic Plants From Minnesota,
W73-15228 5C

Preliminary Chemical Studies of Aquatic Plants from Minnesota,
W73-15229 2H

Toxicity, Anti-Neoplastic, and Coagulation Effects of Aquatic Plants From Minnesota,
W73-15230 5C

Final Environmental Statement Related to the Prairie Island Nuclear Generating Plant.
W73-15256 5C

MINNOWS
Effect on Lime Neutralized Iron Hydroxide Suspensions on Survival, Growth, and Reproduction of the Fathead Minnow (Pimephales Promelas),
W73-15099 5C

MIREX
Residues of Mirex in Channel Catfish and Other Aquatic Organisms,
W73-15091 5C

MISSISSIPPI
Changes in Floodflow Characteristics of a Rectified Channel Caused by Vegetation, Jackson, Mississippi,
W73-14995 2E

Remote Measurement of Salinity in an Estuarine Environment,
W73-15001 2L

MISSISSIPPI RIVER
Briefing--Mississippi River.
W73-15166 4A

MISSOURI
Evaluations of Stream Pollution and Trace Substances in the New Lead Belt of Missouri,
W73-14857 5B

Flood-Volume Design Data for Missouri Streams,
W73-14990 2E

Water and Sewerage Development Plan, Kansas City Metropolitan Region.
W73-15198 5G

MITE PESTS
The Effects of Rainfall and Shade on the Occurrence of Three Mite Pests of Tea in Ceylon,
W73-14940 3F

MIXING
Mixing Processes in Wide Open Channels,
W73-14828 5B

Turbulent Entrainment in Buoyant Jets and Plumes,
W73-14841 5B

MODEL STUDIES
Effects of Development on Salinity and Limnology of the Lower Colorado River,
W73-14756 5C

River Basin Simulation as a Means of Determining Operating Policy for a Water Control System,
W73-14761 6B

Economic Models of Industrial Pollution Control in Regional Planning,
W73-14904 5G

Dynamic Model of Water Movement in Soil Under Various Climatological Conditions,
W73-14972 5B

MOISTURE STRESS
Diurnal Water Stress in Plants Grown on a Coarse Soil,
W73-15216 3F

Plant Moisture Status Effects in Estimation of Evaporation by a Combination Method,
W73-15223 2D

MOLECULAR STRUCTURE
Raman Spectra and Structure of Water in Dimethyl Sulfoxide,
W73-14939 1B

MOLLUSKS
Transport, Distribution, and Degradation of Chlorinated Hydrocarbon Residues in Aquatic Model Ecosystems,
W73-15103 5B

MONITORING
Environmental Monitoring Helps Resolve Pollution Problems,
W73-14917 5A

MONOMOLECULAR FILMS
Modeling and Simulation of Reservoirs to Predict Evaporation Reduction by Surface Films,
W73-14868 3B

MONTANA
Comparison of Microhabitats of Macroscopic Subalpine Stream Algae,
W73-15125 5C

MONTE CARLO METHOD
A Modified Monte Carlo Technique to Solve Groundwater Movement as Affected by Flood Stages,
W73-15055 2F

MOORING FACILITIES
Construction of Mooring Facilities, Ohio River Navigation System (Final Environmental Statement).
W73-15168 8A

MOVEMENT
Dynamic Model of Water Movement in Soil Under Various Climatological Conditions,
W73-14972 5B

MUD REMOVAL
A Rotary Sieve for Removing Mud From Bottom Deposit Samples,
W73-15210 7B

MULTI-POISSON DISTRIBUTION MODEL
A Multi-Poisson Distribution Model for the Treatment of Disinfection Data,
W73-14788 5D

Application of Multi-Poisson Distribution Model for the Treatment of Virucidal and Bactericidal Data,
W73-14789 5D

MULTIPLE-PURPOSE PROJECTS
Multilake River System Operation Rules,
W73-14909 4A

Optimal Sequencing of Capacity Expansion Projects,
W73-14912 6A

The Great Lakes Basin: Alternative Institutional Arrangements for Multi-Purpose Resources Management,
W73-15203 6E

MULTIPLE-PURPOSE RESERVOIRS
A Computer-Implemented Instructional Game for Evaluating Water Management Alternatives,
W73-14772 6B

MUNICIPAL WASTES
A Study of Toxicity and Biostimulation in San Francisco Bay-Delta Waters, Volume III, Acute Toxicity of Discharged Wastes,
W73-14878 5C

MUNICIPAL WATER
Chlorinated Urban Water: A Cause of Dialysis-Induced Hemolytic Anemia,
W73-14928 5F

The Water Reclamation Works at Windhoek (South West Africa),
W73-15214 5D

MUSKEG, PERMAFROST
A Pattern of Muskeg--A Key to Continental Water,
W73-15005 2C

MUSKEGON (MICH.)
Muskegon Sprays Sewage Effluents on Land,
W73-14884 5D

NASSAU RIVER
A Bill to Authorize the Establishment of the Florida Frontier Historic Riverway
W73-15151 6E

NATIONAL ENVIRONMENTAL POLICY ACT
Gillham Lake, Cossatot River, Arkansas, Appendix IV, Appendix V, Appendix VI (Final Environmental Impact Statement)
W73-15138 4A

NAVICULA SPP
Algae of the Cho-Oyu (E. Himalayas) Expedition-II, Bacillariophyceae-II,
W73-15094 5A

NAVIGATION
Method and Means for the Water Transport of Liquids,
W73-14780 5G

NEBRASKA
Use of Ground Water for Irrigation in Seward County, Nebraska in 1971,
W73-14997 4B

Nebraska is No. One.
W73-15171 5B

Animal Waste Disposal and Control of Feedlot Runoff.
W73-15231 5D

Final Environmental Statement Related to Operation of Cooper Nuclear Station.
W73-15237 5B

NEKTON
Wax Esters in Tropical Zooplankton and Nekton and the Geographical Distribution of Wax Esters in Marine Copepods,
W73-15117 5B

NESTOS RIVER BASIN (GREECE-BULGARIA)
Planning the Development of the Nestos River,
W73-14907 4A

NETHERLANDS (WIJDE-BLIK)
Limnological Studies on Some Lakes in the Netherlands: I. A Limnological Reconnaissance and Primary Production of Wijde Blik, an Artificially Deepened Lake,
W73-14890 5C

NETWORKS
Least-Cost Design of Water Distribution Systems,
W73-14911 4A

NEUTRON ACTIVATION ANALYSIS
A Neutron Activation Procedure for the Determination of Dissolved Silver in Sea Water,
W73-14951 5A

NEVADA
Field Spectrometric Measurements of Radionuclide Concentrations and External Gamma Exposure Rates at the Nevada Test Site, A Demonstration Study,
W73-15238 5B

NEW GUINEA (LAKE IPEA)
Vegetation of the Lake Ipea Region, New Guinea Highlands: II. Kayamanda Swamp,
W73-14856 2H

NEW GUINEA (RAMU RIVER)
Flood Characteristics of the Ramu River, New Guinea,
W73-15063 2E

NEW HAMPSHIRE
The Effects of Diminished Groundwater Supplies on Selected New Hampshire Industries
W73-14766 4B

NEW MEXICO
Quantitative Hydrologic Study of a Closed Basin with a Playa (Estancia Valley, New Mexico),
W73-14767 2A

Growth Characteristics of Opuntia Imbricata (Haw.) DC. In New Mexico,
W73-14954 2I

Ecological Investigation of Radioactive Materials in Waste Discharge Areas at Los Alamos for the Period July 1, 1972 - March 31, 1973,
W73-14981 5B

Vegetation Changes as a Result of Soil Ripping on the Rio Puerco in New Mexico,
W73-15213 4D

Another Rio Grande for New Mexico.
W73-15232 3A

NEW YORK
The Formulation of an Outdoor Recreation Supply Function,
W73-14768 6B

The Value of Reservoir Recreation,
W73-14775 6B

Multilake River System Operation Rules,
W73-14909 4A

Prohibitions Against Water Pollution.
W73-15144 6E

NEW ZEALAND (NORTHERN UREWERA)
Introduced Animal Effects and Erosion Phenomena in the Northern Urewera Forests,
W73-15291 4D

NEW ZEALAND (WAIKATO RIVER)
The Accumulation of Arsenic from Arsenic-Rich Natural Waters by Aquatic Plants,
W73-15019 5C

NEWNANS LAKE (FLA)
A Zonal Leaf Spot of Waterhyacinth Caused by Cephalosporium Zonatum,
W73-15226 5C

NICHES
Microdistribution and Feeding of the Net-Spinning Caddisflies (Trichoptera) of a Canadian Stream,
W73-15104 5B

NICKEL
Similarities Between MN, NI and CO Contents of Deep-Sea Clays and Manganese Nodules From the South-West Region of the North Atlantic,
W73-14816 2J

NITRATE REDUCTASE
The Light Dependence of Nitrate Reductase in Marine Phytoplankton,
W73-15082 5B

Nitrate Reductase Activity During a Dinoflagellate Bloom,
W73-15083 5C

ITROGEN
Nitrogen in Industry,
W73-15186 5D

ON-UNIFORM FLOW
Subcritical Kinematic Flow in a Stable Stream,
W73-14839 2E

ONLINEAR PROGRAMMING
Economic Models of Industrial Pollution Control in Regional Planning,
W73-14904 5G

Least-Cost Design of Water Distribution Systems,
W73-14911 4A

ORTH CAROLINA
Textural Trend Analysis of Coastal Barrier Sediments Along the Middle Atlantic Bight, North Carolina,
W73-14810 2J

Water Table Control with Subsurface Irrigation,
W73-14858 3F

Gibbs V. Wright (Action to Determine Right to Obtain Water from Spring),
W73-15160 6E

ORTH DAKOTA
The Population Dynamics of Channel Catfish, Ictalurus punctatus (Rafinesque), in the Little Missouri Arm of Lake Sakakawea. Before and During Commercial Exploitation, 1968-1971,
W73-15261 5C

ORWAY
Hydrographical Data from 2 Soft Water Lakes with Special Reference to Preciptiation (Melt Water),
W73-15299 2H

UCLEAR EXPLOSIONS
Transfer of Tritium from Methane to Vegetation,
W73-14969 5B

Field Spectrometric Measurements of Radionuclide Concentrations and External Gamma Exposure Rates at the Nevada Test Site, A Demonstration Study,
W73-15238 5B

UCLEAR POWERPLANTS
Tritium in the Atmosphere and Ocean,
W73-14965 5B

Forced Exchange of Tritiated Water with Clays,
W73-14971 5B

Final Environmental Statement Related to Operation of Enrico Fermi Atomic Power Plant - Unit 2.
W73-14979 5B

Final Environmental Statement Related to Operation of Duane Arnold Energy Center.
W73-14980 5B

Vulnerability and Survival of Young Connecticut River Fish Entrained at a Nuclear Power Plant,
W73-15100 5C

Sources of Tritium and Its Behavior Upon Release to the Environment,
W73-15234 5B

Final Environmental Statement Related to Operation of Virgil C. Summer Nuclear Station Unit 1.
W73-15235 5B

Final Environmental Statement Related to Operation of Quad-Cities Nuclear Power Station Units 1 and 2.
W73-15236 5B

Final Environmental Statement Related to Operation of Cooper Nuclear Station.
W73-15237 5B

Final Environmental Statement Related to Operation of Turkey Point Plant, Units 3 and 4.
W73-15243 5B

Final Environmental Statement Related to the Prairie Island Nuclear Generating Plant.
W73-15256 5C

NUCLEAR WASTES
Geologic Appraisal of Paradox Basin Salt Deposits for waste Emplacement,
W73-14820 5B

Iaea Research Contracts, Thirteenth Annual Report.
W73-14960 5G

Tumbleweed and Cheatgrass Uptake of Transuranium Elements Applied to Soil as Organic Acid Complexes,
W73-14975 5B

Tritium Uptake and Loss in Grass Vegetation When Exposed to an Atmospheric Source of Tritiated Water,
W73-14976 5B

Plutonium in Lake Michigan Water,
W73-14977 5B

Ecological Investigation of Radioactive Materials in Waste Discharge Areas at Los Alamos for the Period July 1, 1972 - March 31, 1973,
W73-14981 5B

Role of Organic Materials in a Water Course with Respect to Radioactive Contamination. Method of Extraction, Fractionation and Identification by Spectroscopy and Their Affinity to Radionuclides,
W73-14982 5B

Great Lakes Radioecology,
W73-15239 5B

Considerations in the Assessment of the Consequences of Effluents from Mixed Oxide Fuel Fabrication Plants. Environmental Considerations Affecting Consequences of Releases,
W73-15241 5B

Role of the Organic Matter of a Waterway with Regard to Radioactive Pollution (Influence Des Conditions D'Extraction Sur Le Fractionnement Comportement Des Elements Chimiques Vis-A-Vis De La Matiere Organique),
W73-15244 5B

A Method for the Determination of Strontium-90 and Cesium-137 in River Sediments and Soils,
W73-15245 5A

Radiological and Environmental Research Division Annual Report,
W73-15246 5B

Radiocesium Distribution in Water, Sediment, and Biota in the Hudson River Estuary from 1964 through 1970,
W73-15247 5B

Assimilation and Retention of ZN65 by the Mallard Duck (Anas Platyrhynchus),
W73-15248 5B

Occurrence of Radionuclides in the Exoskeleton of Turtles,
W73-15249 5B

Uptake and Retention of Tungsten-181 by Crayfish (Cambarus longulus longerostris Ort.),
W73-15250 5B

An Apparatus for the Reduction of Tritium Emissions into the Atmosphere,
W73-15257 5G

NUPHAR SPP
Toxicity, Anti-Neoplastic, and Coagulation Effects of Aquatic Plants From Minnesota,
W73-15230 5C

NUTRIENT INACTIVATION
Eutrophication Control: Nutrient Inactivation by Chemical Precipitation at Horseshoe Lake, Wisconsin,
W73-14889 5G

NUTRIENT REMOVAL
Eutrophication Control: Nutrient Inactivation by Chemical Precipitation at Horseshoe Lake, Wisconsin,
W73-14889 5G

NUTRIENT REQUIREMENTS
Comparative Drought Resistance of Bos indicus and Bos taurus Crossbred Herds in Central Queensland. Relative Mortality Rates, Calf Birth Weights, and Weight Changes of Breeding Cows,
W73-15221 3F

NUTRIENTS
An Investigation of Selected Physical and Chemical Characteristics of Two Subarctic Streams,
W73-14867 5B

Semi-Continuous Culture of Bacteria on Membrane Filters: I. Use for the Bioassay of Inorganic and Organic Nutrients in Aquatic Environments,
W73-14891 5B

Nitrate Reductase Activity During a Dinoflagellate Bloom,
W73-15083 5C

Influence of Macro-Nutrients on the Relative Growth of Water Plants in the Qu'Appelle Lakes,
W73-15107 5C

NYMPHAEA SPP
Toxicity, Anti-Neoplastic, and Coagulation Effects of Aquatic Plants From Minnesota,
W73-15230 5C

OAKWOOD BOTTOMS GREENTREE RESERVOIR (TENN)
Seasonal Fluctuations of Aquatic Macroinvertebrates in Oakwood Bottoms Greentree Reservoir,
W73-15209 5C

OCEAN CURRENTS
Suspended Matter in Surface Waters of the Eastern Gulf of Guinea,
W73-14817 2L

OCEANOGRAPHY
Some Facets of the Impact of Pulp Mill Effluent on the Alberni Inlet,
W73-14932 5B

Synoptic Measurements of Currents and Sediment Transport on the Continental Shelf, (Annual Progress Report),
W73-15242 5B

ODOR
Water Quality Criteria for European Freshwater Fish. Report on Monohydric Phenols and Inland Fisheries,
W73-15086 5C

Correlating Oil and Odorous Components in Stored Dairy Manure,
W73-15177 5B

Using Odor Intensity Limits in Air Quality Standards,
W73-15178 5G

ODOR CONTROL
Principles of Feedlot Odor Control.
W73-15181 5B

ODOR INTENSITY INDEX
Correlating Oil and Odorous Components in Stored Dairy Manure,
W73-15177 5B

OHIO
Water Quality and Mineral Solubilities in Surface and Ground Water; Oak Openings Community, Lucas Co., Ohio,
W73-14863 4B

An Inventory and Analysis of Existing Storm Drainage Systems in the Toledo Regional Area.
W73-15021 4A

OHIO RIVER
Aquifer Diffusivity of the Ohio River Alluvial Aquifer by the Flood-Wave Response Method,
W73-14991 2F

Construction of Mooring Facilities, Ohio River Navigation System (Final Environmental Statement).
W73-15168 8A

OIL DISPERSANTS
In Vitro Hydroloysis of Polyoxyethylene Esters by Tissues of The American Eel and Atlantic Salmon,
W73-15087 5B

OIL POLLUTION
Mapping Hydrocarbon Seepages in Water-Covered Regions,
W73-14776 5G

Method of Recovering Oil from a Water Surface,
W73-14777 5G

Method and Means for the Water Transport of Liquids,
W73-14780 5G

Sublethal Effects of Crude Oil on Lobster, (Homarus americanus) Behavior,
W73-14894 5C

Lerro V. Thomas Wynne, Inc (Action by Property Owners Through Whose Property Creek Flowed and Who were Affected by Presence of Fuel Oil in the Creek)
W73-15157 6E

OIL SPILLS
Method of Recovering Oil from a Water Surface,
W73-14777 5G

OIL WELLS
Sizing Gravel-Pack-Liner Slots in Oil and Gas Wells,
W73-15192 8G

OKLAHOMA
Objective Regionalization of Peak Flow Rates,
W73-15057 2E

OLEATES
Biodegradation of Oleates,
W73-15127 5B

OLIGOCHAETES
Invertebrate Movements and Some Diel and Seasonal Changes in A Sierra Nevada Peatland,
W73-15105 5C

ON-SITE TESTS
Simple Apparatus for Conducting Acute Toxicity Bioassays Under Field Conditions,
W73-15084 5A

An in Situ Method for Measuring Primary Productivity of Arctic Sea Ice Algae,
W73-15122 5A

OPEN CHANNEL FLOW
Mixing Processes in Wide Open Chennels,
W73-14828 5B

OPTIMAL DEVELOPMENT PLANS
Water Resources and Utilization (Voda--resursy i potrebleniye),
W73-14846 6B

OPTIMIZATION
Mathematical Modeling of Urban Water Management Strategies,
W73-14757 6B

Optimal Sequencing of Capacity Expansion Projects,
W73-14912 6A

Simulation and Optimization of Acid Mine Drainage Abatement Alternatives,
W73-14913 5G

OREGON
Days Creek Lake Project, SOUTH Umpqua River, Douglas County, Oregon, (Final Environmental Statement).
W73-15017 4A

OREGON (UPPER KLAMATH RIVER)
Some Cladocera and Copepods from the Upper Klamath River Basin,
W73-15294 5C

ORGANIC COMPOUNDS
Mapping Hydrocarbon Seepages in Water-Covered Regions,
W73-14776 5G

The Determination of Chlorinated Aliphatic Hydrocarbons in Air, Natural Waters, Marine Organisms, and Sediments,
W73-14952 5A

ORGANIC MATTER
Oxygen Uptake of Bottom Sediments Studied in Situ and in the Laboratory,
W73-14822 5B

Role of Organic Materials in a Water Course with Respect to Radioactive Contamination. Method of Extraction, Fractionation and Identification by Spectroscopy and Their Affinity to Radionuclides,
W73-14982 5B

ORGANIC SOILS
Role of Organic Materials in a Water Course with Respect to Radioactive Contamination. Method of Extraction, Fractionation and Identification by Spectroscopy and Their Affinity to Radionuclides,
W73-14982 5B

ORGANIC WASTES
Tubificids and Water Quality: A Review,
W73-15109 5C

ORGANIZATIONS
Soviet National Committee of the International Association for Hydraulic Research (Sovetskiy natsional'nyy komitet Mezhdunarodnoy assotsiatsii po gidravlicheskim issledovaniyam),
W73-15014 2A

ORTHOPHOSPHATES
Kinetics of Orthophosphate Uptake by Phytoplankton Populations in Lake Winnebago,
W73-14918 5C

OSWEGO RIVER SYSTEM (NY)
Multilake River System Operation Rules,
W73-14909 4A

OUTFALL SEWERS
Florida Courts and Water Pollution: A Floating Crap Game,
W73-15152 6E

OXIDATION
Some Reactions of Chlorine and Oxy-Chlorine Species with Organic Compounds in Aqueous Media,
W73-14799 5B

OXYGEN DEMAND
Oxygen Uptake of Bottom Sediments Studied in Situ and in the Laboratory,
W73-14822 5B

OXYGEN EVOLUTION
Differential Responses of Marine Phytoplankton to Herbicides: Oxygen Evolution,
W73-14883 5C

OYSTERS
Effects of Brief Temperature Increases on Larvae of the American Oyster (Crassostrea Virginica),
W73-15124 5C

Turnover of Zn65 in Oysters,
W73-15254 5C

OZONE
Disinfection of Water and Wastewater Using Ozone,
W73-14796 5D

Economical Wastewater Disinfection with Ozone,
W73-14797 5D

Recycle, What Disinfectant for Safe Water Then,
W73-14802 5D

Disinfection of Wastewater Effluents for Virus Inactivation,
W73-14806 5D

PACIFIC OCEAN
Marine Geology of the Aleutian Abyssal Plain,
W73-14811 2J

PACIFIC SALMON
Yolk-Sac Malformation in Pacific Salmon in Relation to Substrate, Temperature, and Water Velocity,
W73-15102 5C

PACIFIC SPINY DOGFISH
Exposure of Dogfish Shark Feti to Mercury,
W73-15088 5C

PAKISTAN
Salt Tolerance and Cation Interaction in Alkali Sacaton at Germination,
W73-15215 3C

PAKISTAN (MANGLA DAM)
Sedimentation in Mangla Reservoir,
W73-14845 2J

PAKISTAN (TARBELA DAM PROJECT)
Tarbela Dam Project, Pakistan,
W73-15211 8A

PARADOX BASIN (UTAH AND COLO)
Geologic Appraisal of Paradox Basin Salt Deposits for waste Emplacement,
W73-14820 5B

PARASITES
On the Origin of the Whiting (Merlangius Merlangus (L.) in Kiel Bay, (In German),
W73-15278 2L

PARASTENOCARIS
Brazilian Ground Water Crustacea: 1. Studies on the Genera Parastenocaris Kessler and Forficatocaris Jakobi from Serra Do Mar of Sao Paulo (Copepoda, Harpacticoidea), (In German),
W73-15277 2I

PARATHION
Comparison of the Metabolism of Parathion by Lobsters and Rats,
W73-15090 5C

Effect of SKF-525A on Brain Acetylcholinesterase Inhibition by Parathion in Fishes,
W73-15119 5C

PARTICLE SIZE
An Appraisal of the Computation of Statistical Parameters in Grain Size Analysis,
W73-15264 2J

PATENTS
Mapping Hydrocarbon Seepages in Water-Covered Regions,
W73-14776 5G

Method of Recovering Oil from a Water Surface,
W73-14777 5G

Overflow Arrangement,
W73-14778 5D

Filter Press, More Particularly for Dewatering Sludge in Sewage Treatment Plants,
W73-14779 5D

Method and Means for the Water Transport of Liquids,
W73-14780 5G

PATH OF POLLUANTS
Feeding Rates and Food Utilization of Stream Caddisfly Larvae of the Genus Neophylax (Trichoptera:Limnephilidae) Using Cobalt-60 and Carbon-14,
W73-15252 5B

PATH OF POLLUTANT
Transfer of Tritium from Methane to Vegetation,
W73-14969 5B

PATH OF POLLUTANTS
New Fluorescent Tracer Detection Techniques for use in Polluted Environments,
W73-14770 5B

The Effect of Sorption on the Migration of Be-7 From a High Energy Accelerator Constructed on a Chalk Site,
W73-14821 5B

Mixing Processes in Wide Open Chennels,
W73-14828 5B

Turbulent Entrainment in Buoyant Jets and Plumes,
W73-14841 5B

Effects of Sanitary Landfills on Ground and Surface-Water Movement and Water Quality,
W73-14859 5B

A Numerical Model of Estuarine Pollutant Transport,
W73-14900 5B

Iaea Research Contracts, Thirteenth Annual Report.
W73-14960 5G

Tumbleweed and Cheatgrass Uptake of Transuranium Elements Applied to Soil as Organic Acid Complexes,
W73-14975 5B

Tritium Uptake and Loss in Grass Vegetation When Exposed to an Atmospheric Source of Tritiated Water,
W73-14976 5B

Plutonium in Lake Michigan Water,
W73-14977 5B

Role of Organic Materials in a Water Course with Respect to Radioactive Contamination. Method of Extraction, Fractionation and Identification by Spectroscopy and Their Affinity to Radionuclides,
W73-14982 5B

Fundamental Problems of Groundwater Conservation (Osnovnyye problemy okhrany podzemnykh vod),
W73-15009 5B

Uptake of Selenium by Aquatic Organisms,
W73-15079 5B

PATHOGENIC BACTERIA
The Effects of Differently Extracted Endotoxins from Escherichia Coli on Rainbow Trout (Salmo Gairdneri),
W73-14769 5C

PATHOGENIC FUNGI
Location, Identification, and Characterization of Pathogens of the Water Hyacinth,
W73-14758 5C

New and Rare Aquatic Fungal Species Isolated from Stock Ponds in the Leningrad Region, (In Russian),
W73-14887 5C

PATHOGENS (SOIL-BORNE)
The Ecology of Soil-Borne Pathogens,
W73-15281 5B

PATHOLOGY
Sublethal Effects of Crude Oil on Lobster, (Homarus americanus) Behavior,
W73-14894 5C

PEAK DISCHARGE
Application of the Method of Gradex,
W73-15033 2E

Objective Regionalization of Peak Flow Rates,
W73-15057 2E

PEAT
A Pattern of Muskeg--A Key to Continental Water,
W73-15005 2C

Invertebrate Movements and Some Diel and Seasonal Changes in A Sierra Nevada Peatland,
W73-15105 5C

PENALTIES (LEGAL)
Prohibitions Against Water Pollution.
W73-15144 6E

PENNSYLVANIA
Cover Response of Fish in Bioassay of Acid Water,
W73-14901 5C

Effects of Acid Mine Drainage on Fish Populations,
W73-14902 5C

Acute Toxicity of Low pH to Aquatic Insects,
W73-14903 5C

Simulation and Optimization of Acid Mine Drainage Abatement Alternatives,
W73-14913 5G

Treatment of Sulfite Pulp and Paper Mill Waste,
W73-14938 5D

Log-Pearson Type III and Gumbel Analyses of Floods,
W73-15049 2E

Lerro V. Thomas Wynne, Inc. (Action by Property Owners Through Whose Property Creek Flowed and Who were Affected by Presence of Fuel Oil in the Creek).
W73-15157 6E

PERIDINIUM TRIQUETRUM
Nitrate Reductase Activity During a Dinoflagellate Bloom,
W73-15083 5C

PERIOD OF GROWTH
An Economic Comparison of Short and Full Season Cotton Production in Arizona,
W73-15217 3F

PERMAFROST, MUSKEG
A Pattern of Muskeg--A Key to Continental Water,
W73-15005 2C

PERMITS
Prohibitions Against Water Pollution.
W73-15144 6E

PERSIAN GULF
Morphology and Development of a New Alga, Haloplegma Anwerii (Ceramiaceae) from Karachi Coast,
W73-15133 5A

PESTICIDE KINETICS
Differential Responses of Marine Phytoplankton to Herbicides: Oxygen Evolution,
W73-14883 5C

PESTICIDE RESIDUES
Residues of Mirex in Channel Catfish and Other Aquatic Organisms,
W73-15091 5C

PESTICIDE TOXICITY
Differential Responses of Marine Phytoplankton to Herbicides: Oxygen Evolution,
W73-14883 5C

Effects of Exposure to Sublethal DDT on the Exploratory Behavior of Goldfish (Carassium auratus),
W73-15085 5C

Comparison of the Metabolism of Parathion by Lobsters and Rats,
W73-15090 5C

Toxicity of TFM (Lampricide) to Six Early Life Stages of Rainbow Trout (Salmo gairdneri),
W73-15096 5C

Synergism of Insecticides by Herbicides,
W73-15112 5C

Effect of SKF-525A on Brain Acetylcholinesterase Inhibition by Parathion in Fishes,
W73-15119 5C

Toxicology of Pesticides: Recent Advances,
W73-15126 5C

PHENOLOGICAL OBSERVATIONS
Climatological Notes of 1972 - Minnesota,
W73-14763 2B

PHENOLS
Water Quality Criteria for European Freshwater Fish. Report on Monohydric Phenols and Inland Fisheries,
W73-15086 5C

PHOSPHATES
Phosphate Retention by Lake Sediments,
W73-14751 5B

Influence of Macro-Nutrients on the Relative Growth of Water Plants in the Qu'Appelle Lakes,
W73-15107 5C

A Bill to Amend the Federal Water Pollution Control Act by Establishing Standards for Synthetic Detergents.
W73-15150 6E

PHOSPHORUS
Phosphorus Flux Across A Coral Reef,
W73-14892 5B

Productivity of an Arid Zone Shrub (Eremophila gilesii) Community in South-Western Queensland,
W73-15219 2I

PHOTOGRAMMETRY
Statistical Comparison of Airborne Laser and Stereophotogrammetric Sea Ice Profiles,
W73-14999 2C

PHOTOGRAPHIC WASTES
Toxic Effects of Color Photographic Processing Wastes on Biological Systems,
W73-14893 5C

PHOTOGRAPHY
Toxic Effects of Color Photographic Processing Wastes on Biological Systems,
W73-14893 5C

PHOTOSYNTHESIS
The Detection of a Bound Ferredoxin in the Photosynthetic Lamellae of Blue-Green Algae and other Oxygen Evolving Photosynthetic Organisms,
W73-14882 5C

Stomatal Resistance, Net Photosynthesis and Transpiration in PMA-Treated Sorghum: A Field Study,
W73-15300 3F

PHOTOSYNTHETIC RATES
An in Situ Method for Measuring Primary Productivity of Arctic Sea Ice Algae,
W73-15122 5A

PHRAGMITES COMMUNIS
Microfungi Colonizing Submerged Standing Culms of Phragmites Communis Trin,
W73-15131 5C

Microfungi Colonizing Collapsed Aerial Parts of Phragmites Communis Trin. in Water,
W73-15132 5C

PHYCOMYCETES
The Occurrence and Distribution of some Aquatic Phycomycetes on Ross Island and the Dry Valleys of Victoria Land, Antarctica,
W73-15120 5B

PHYTOPLANKTON
Differential Responses of Marine Phytoplankton to Herbicides: Oxygen Evolution,
W73-14883 5C

Kinetics of Orthophosphate Uptake by Phytoplankton Populations in Lake Winnebago,
W73-14918 5C

The Light Dependence of Nitrate Reductase in Marine Phytoplankton,
W73-15082 5B

Growth and Toxicity Tests on the Marine Nanoplanktonic Alga Platymonas Tetrathele G.S. West in the Presence of Crude Oil and Emulsifiers,
W73-15106 5C

Phytoplankton Organization in Baie Des Chaleurs (Gulf of St Lawrence),
W73-15111 2L

Sensitivity of Dunaliella and Scenedesmus (Chlorophyceae) to Chlorinated Hydrocarbons,
W73-15114 5C

PHYTOTOXICITY
Growth and Toxicity Tests on the Marine Nanoplanktonic Alga Platymonas Tetrathele G.S. West in the Presence of Crude Oil and Emulsifiers,
W73-15106 5C

PILOT PLANTS
Reverse Osmosis Concentration of Spent Liquor Solids in Press Liquors from High-Density Pulps,
W73-14923 5D

PINGERPROBE
Observations of Shallow Layering Utilizing the Pingerprobe Echo-Sounding System,
W73-14812 2J

PIPES
Least-Cost Design of Water Distribution Systems,
W73-14911 4A

PLANKTONIC POPULATIONS
Successions of Planktonic Organisms in Ground Water Recharge Basins Fed by River Water,
W73-15290 5G

PLANNING
Optimal Sequencing of Capacity Expansion Projects,
W73-14912 6A

Integrated Hydrologic and Societal Interactions to Floods and Droughts in India,
W73-15046 2E

Flood Control Planning with Inadequate Hydrologic Data,
W73-15048 4A

Water and Sewerage Development Plan, Kansas City Metropolitan Region.
W73-15198 5G

A Plan for Water and Sewer, (Chatham County - Savannah).
W73-15199 5G

Municipal Sewage Treatment Systems--Inventory of the Structure and Functions of Rhode Island's Public Sewage Treatment Systems.
W73-15200 5D

Interim Plan for Water Quality Management in the Denver Metropolitan Area-Addendum No 2.
W73-15201 5G

PLANT GROWTH
Major Cause of Algae and Weeds in Lake Mendota,
W73-14895 5C

Growth and Toxicity Tests on the Marine Nanoplanktonic Alga Platymonas Tetrathele G.S. West in the Presence of Crude Oil and Emulsifiers,
W73-15106 5C

Influence of Macro-Nutrients on the Relative Growth of Water Plants in the Qu'Appelle Lakes,
W73-15107 5C

The Structure and Development of a Form of Dinococcus Oedogonii (Geitler) Fott,
W73-15129 5C

Morphology and Development of a New Alga, Haloplegma Anwerii (Ceramiaceae) from Karachi Coast,
W73-15133 5A

Diurnal Water Stress in Plants Grown on a Coarse Soil,
W73-15216 3F

Salinity, Plant Growth, and Metabolism,
W73-15218 3C

PLANT GROWTH SUBSTANCES
Life History and Growth Inhibition Studies in Platydorina caudata (Volvocaceae),
W73-14899 5C

PLANT MORPHOLOGY
The Structure and Development of a Form of Dinococcus Oedogonii (Geitler) Fott,
W73-15129 5C

Morphology and Development of a New Alga, Haloplegma Anwerii (Ceramiaceae) from Karachi Coast,
W73-15133 5A

PLANT PATHOLOGY
Location, Identification, and Characterization of Pathogens of the Water Hyacinth,
W73-14758 5C

A Zonal Leaf Spot of Waterhyacinth Caused by Cephalosporium Zonatum,
W73-15226 5C

Aphanomyces Blight of Amazon Sword Plants,
W73-15227 5C

PLANT PHYSIOLOGY
Salt Tolerance and Cation Interaction in Alkali Sacaton at Germination,
W73-15215 3C

PLANT TISSUES
Plant Moisture Status Effects in Estimation of Evaporation by a Combination Method,
W73-15223 2D

PLATYDORINA CAUDATA
Life History and Growth Inhibition Studies in Platydorina caudata (Volvocaceae),
W73-14899 5C

PLATYMONAS TETRATHELE
Growth and Toxicity Tests on the Marine Nanoplanktonic Alga Platymonas Tetrathele G.S. West in the Presence of Crude Oil and Emulsifiers,
W73-15106 5C

PLAYAS
Quantitative Hydrologic Study of a Closed Basin with a Playa (Estancia Valley, New Mexico),
W73-14767 2A

PLUMES
Turbulent Entrainment in Buoyant Jets and Plumes,
W73-14841 5B

PLUTONIUM
Plutonium in Lake Michigan Water,
W73-14977 5B

Ecological Investigation of Radioactive Materials in Waste Discharge Areas at Los Alamos for the Period July 1, 1972 - March 31, 1973,
W73-14981 5B

Pacific Northwest Laboratory Annual Report for 1972. Volume II: Physical Sciences, Part 1. Atmospheric Sciences,
W73-15233 5B

Great Lakes Radioecology,
W73-15239 5B

The Use of Natural and Fallout Radionuclides to Measure Recent Sedimentation Rates in Southern Lake Michigan,
W73-15240 5B

Considerations in the Assessment of the Consequences of Effluents from Mixed Oxide Fuel Fabrication Plants. Environmental Considerations Affecting Consequences of Releases,
W73-15241 5B

Radiological and Environmental Research Division Annual Report,
W73-15246 5B

POLAND (LAKE JEZIORAK)
Occurrence of Microorganisms of Decomposing Organic Phosphorus Compounds in 2 Types of Bottom Sediments of the Eutrophic Lake Jeziorak,
W73-15293 5C

POLARIZATION
New Fluorescent Tracer Detection Techniques for use in Polluted Environments,
W73-14770 5B

POLARIZED TRACERS
New Fluorescent Tracer Detection Techniques for use in Polluted Environments,
W73-14770 5B

POLLUTANT IDENTIFICATION
Environmental Monitoring Helps Resolve Pollution Problems,
W73-14917 5A

Origin of Toxic Materials in the Kraft Pulping Process,
W73-14931 5B

The Determination of Chlorinated Aliphatic Hydrocarbons in Air, Natural Waters, Marine Organisms, and Sediments,
W73-14952 5A

Laboratory System for Tritium Analysis of Large Numbers of Environmental Samples,
W73-14973 5B

Exposure of Dogfish Shark Feti to Mercury,
W73-15088 5C

Ion Selective Flow-Through Electrodes: Construction and Properties of Heavy Metal Sensors,
W73-15170 5A

POLLUTANTS
The Determination of Chlorinated Aliphatic Hydrocarbons in Air, Natural Waters, Marine Organisms, and Sediments,
W73-14952 5A

POLLUTION ABATEMENT
Mapping Hydrocarbon Seepages in Water-Covered Regions,
W73-14776 5G

Method of Recovering Oil from a Water Surface,
W73-14777 5G

Filter Press, More Particularly for Dewatering Sludge in Sewage Treatment Plants,
W73-14779 5D

Economic Models of Industrial Pollution Control in Regional Planning,
W73-14904 5G

Simulation and Optimization of Acid Mine Drainage Abatement Alternatives,
W73-14913 5G

A General Perspective Concerning the Cost of Pollution Abatement at any Specified Level,
W73-14921 5D

Kraft Multistage Bleach Plant Effluents,
W73-14922 5B

Oji (Paper Co.), Kasugai Mill Positively Grappling With Environmental Problem,
W73-14958 5D

Kamloops Pollution Curbs are B.C.'S Most Extensive.
W73-14959 5D

POLLUTION CONTROL TREATMENT
The 'Savo' Method Treats Industrial Process Water.
W73-14933 5D

POLYCHLORINATED BIPHENYLS
A Study of the Distribution of Polychlorinated Biphenyls in the Aquatic Environment,
W73-14992 5B

Temperature Selection of Atlantic Salmon (Salmo Salar) and Brook Trout (Salvelinus Fontinalis) as Influenced by Various Chlorinated Hydrocarbons,
W73-15097 5C

POLYOXYETHYLENE ESTERS
In Vitro Hydroloysis of Polyoxyethylene Esters by Tissues of The American Eel and Atlantic Salmon,
W73-15087 5B

PONDS
Some Desmids from Uganda,
W73-15208 5C

PONTEDERIACEAE
Preliminary Data on Biology and Specificity of Acigona Ignitalis Hamps. (LEP., Pyralidae) on the Host Plant Eichhornia Crassipes (Mart.) Solms Laubach (Pontederiaceae), (In Spanish),
W73-15286 5G

POROUS MEDIA
Wettability as Related to Capillary Action in Porous Media,
W73-15195 8D

POTABLE WATER
Handbook of Chlorination for Potable Water, Wastewater, Cooling Water, Industrial Processes, and Swimming Pools,
W73-14915 5F

Recycled Water Poses Disinfectant Problem.
W73-14943 5D

Method for Purification and Disinfection of Surface Waters by Means of Low-Frequency Alternating Current (Metoda Pentru Epurarea si Dezinfectarea Apelor de Suprafata cu Ajutorul Curentului Alternativ de Joasa Frecvent a),
W73-14957 5F

Monitoring the Dose of Fluorine in Fluoridation of Drinking Water, (In Russian),
W73-15089 5A

The Water Reclamation Works at Windhoek (South West Africa),
W73-15214 5D

Yersinia Enterocolitica in Drinking-Water,
W73-15274 5A

POTATO WASTES
Waste Waters of Potato Wash and Peel Installations, (In German),
W73-15153 5D

POTATOES
Plant Moisture Status Effects in Estimation of Evaporation by a Combination Method,
W73-15223 2D

POULTRY
Techniques for the Sampling and Handling of Anaerobic Microbes in Waste Fermentation Systems,
W73-15172 5A

PRE-IMPOUNDMENT
Impacts of Water-Resource Development in the Snake River Area on Wildlife,
W73-14773 6G

PRECIPITATION
Hydrographical Data from 2 Soft Water Lakes with Special Reference to Preciptiation (Melt Water),
W73-15299 2H

PRECIPITATION (ATMOSPHERIC)
Climatological Notes of 1972 - Minnesota,
W73-14763 2B

Deforestation Effects on Soil Moisture, Streamflow, and Water Balance in the Central Appalachians,
W73-14919 4D

Pacific Northwest Laboratory Annual Report for 1972. Volume II: Physical Sciences, Part 1. Atmospheric Sciences,
W73-15233 5B

PREDICTION
The Dose to Man via Food-Chain Transfer Resulting from Exposure to Tritiated Water Vapor,
W73-14967 5C

PRESSURIZED WATER REACTOR
Final Environmental Statement Related to Operation of Virgil C. Summer Nuclear Station Unit 1.
W73-15235 5B

PRESSURIZED WATER REACTORS
Final Environmental Statement Related to the Prairie Island Nuclear Generating Plant.
W73-15256 5C

PRESSURIZED WATER REACTORS. *ENVIRONMENTAL IMPACT STATEMENTS
Final Environmental Statement Related to Operation of Turkey Point Plant, Units 3 and 4.
W73-15243 5B

PRIMARY PRODUCTION
Limnological Studies on Some Lakes in the Netherlands: I. A Limnological Reconnaissance and Primary Production of Wijde Blik, an Artificially Deepened Lake,
W73-14890 5C

PRIMARY PRODUCTIVITY
Unreliability of the C-14 Method for Estimating Primary Productivity in Eutrophic Dutch Coastal Waters,
W73-15078 5A

An in Situ Method for Measuring Primary Productivity of Arctic Sea Ice Algae,
W73-15122 5A

PRIOR APPROPRIATION
Meandering Rights for Contracted Water,
W73-15143 6E

PROBABILITY
Application of the Method of Gradex,
W73-15033 2E

Reliability of Estimates of the Exceedence Probability of a Given Flood Magnitude,
W73-15051 2E

A New Proposal for Computation of Flood Frequency,
W73-15052 2E

Significance of the Genesis of Floods on Probability Analysis,
W73-15062 2E

Statistical Properties of Runs as Applied to Hydrologic Droughts,
W73-15075 2E

Theoretical Studies on Gamma-Type Distribution and Runs--Their Applications to Hydrology,
W73-15077 7C

PROBABLE MAXIMUM FLOOD
Flood Control Planning with Inadequate Hydrologic Data,
W73-15048 4A

PROBABLE MAXIMUM PRECIPITATION
Probable Maximum Precipitation--The Concept, Current Procedures, and Outlook,
W73-15034 2B

A Proposal for Estimating Tropical Storm Probable Maximum Precipitation (PMP) for Sparse-Data Regions,
W73-15035 2B

PRODUCTIVITY
Phosphorus Flux Across A Coral Reef,
W73-14892 5B

Productivity of an Arid Zone Shrub (Eremophila gilesii) Community in South-Western Queensland,
W73-15219 2I

PROJECT PLANNING
Financing Alternatives for Regional Resource Development,
W73-14861 6B

Evaluating Federal Water Projects: A Critique of Proposed Standards,
W73-14926 6A

PROJECTS
Annual Report of Activities During Fiscal Year 1973.
W73-14752 9D

Ninth Annual Report Water Resources Research Center.
W73-14872 9D

PROTEINS
Chromic Oxide and Crude Protein Excretion in the Bovine as Influenced by Water Restriction,
W73-15182 5B

PSEUDOMONAS AERUGINOSA
Biodegradation of Oleates,
W73-15127 5B

PUBLIC HEALTH
Chlorinated Urban Water: A Cause of Dialysis-Induced Hemolytic Anemia,
W73-14928 5F

Recycled Water Poses Disinfectant Problem.
W73-14943 5D

The Dose to Man via Food-Chain Transfer Resulting from Exposure to Tritiated Water Vapor,
W73-14967 5C

Guidance for Limiting Environmental Releases of Tritium,
W73-14968 5B

The Bacteriological Examination of Water Supplies
W73-15191 5F

PUBLIC RESOURCES
The Value of Reservoir Recreation.
W73-14775 6B

PUBLICATIONS
Man and the Environment. A Bibliography of Selected Publications of the United Nations System, 1946-1971
W73-14974 5C

PULP AND PAPER INDUSTRY
Great Lakes Paper External Feedwater System for High-Pressure Boilers,
W73-14930 5F

Controlling Iron and Copper Deposits in Modern High-Pressure Boilers,
W73-15187 5F

PULP WASTES
New Adsorption Process for Removing Color from Kraft Mill Effluents,
W73-14784 5D

Purification of Waste Waters by Means of Aerated Lagoons (L'epuration des eaux residuaires par lagunage aere),
W73-14916 5D

Kraft Multistage Bleach Plant Effluents,
W73-14922 5B

Reverse Osmosis Concentration of Spent Liquor Solids in Press Liquors from High-Density Pulps,
W73-14923 5D

Use of Mixed Media in Water Plant Filtration,
W73-14924 5D

Control of Sulphite Pulping Wastes in the United States,
W73-14929 5D

Origin of Toxic Materials in the Kraft Pulping Process,
W73-14931 5B

Some Facets of the Impact of Pulp Mill Effluent on the Alberni Inlet,
W73-14932 5B

The 'Savo' Method Treats Industrial Process Water.
W73-14933 5D

Purification of Effluents from the Production of Bleached Sulfite Pulp by the Activated Sludge Method (Oczyszczanie metoda osadu czynnego sciekow z produkciji masy celulozowej siarczynowej bielonej),
W73-14934 5D

Waste Water Clarification in the Paper Industry Through Modern Retention Aids (Abwasserklaerung in der Papierindustrie durch moderne Retentionsmittel),
W73-14935 5D

Program Attacks Land, Water, Air Pollution.
W73-14936 5D

Treatment of Sulfite Pulp and Paper Mill Waste,
W73-14938 5D

A Study of Renovation of Pulp Mill Waste Water: Adsorption Characteristics of Kraft

Pulp Lignin on Activated Carbon, (In Japanese),
W73-14941 5D

Rapid Method for Determination of the Activity and Concentration of Activated Sludge (Ekspress-metod opredeleniya aktivnosti ila i ego kontsentratsii),
W73-14945 5D

Activated Sludge Process In Sulphate Pulp Waste Liquor, (In Japanese),
W73-14946 5D

Activated Sludge Process In Sulphate Pulp Waste Liquor. Part II. Contact-Stabilization Process and Pilot-Plant Experiments,
W73-14947 5D

Removal of Dyes from Waste Waters (Udalenie krasitelei iz stochnykh vod),
W73-14948 5D

Treatment of Soda Recovery Boiler Feedwater with Trilon (Trilonnaya obrabotka kotlovoi vody sodregeneratsionnykh agregatov),
W73-14949 5D

Oji (Paper Co.), Kasugai Mill Positively Grappling With Environmental Problem,
W73-14958 5D

Kamloops Pollution Curbs are B.C.'S Most Extensive.
W73-14959 5D

Effects of Oxygen Pulping on Toxicity and Colour of Effluent,
W73-15188 5G

On Spent Semichemical Pulping Liquors. (I). Species Variation of Pulping Timbers Color and Chemical Oxygen Demand, (In Japanese),
W73-15189 5B

PULPWOOD

On Spent Semichemical Pulping Liquors. (I). Species Variation of Pulping Timbers Color and Chemical Oxygen Demand, (In Japanese),
W73-15189 5B

PYRALIDAE

Preliminary Data on Biology and Specificity of Acigona Ignitalis Hamps. (LEP., Pyralidae) on the Host Plant Eichhornia Crassipes (Mart.) Solms Laubach (Pontederiaceae), (In Spanish),
W73-15286 5G

PYRROPHYTA

The Structure and Development of a Form of Dinococcus Oedogonii (Geitler) Fott,
W73-15129 5C

QU'APPELLE LAKES

Influence of Macro-Nutrients on the Relative Growth of Water Plants in the Qu'Appelle Lakes,
W73-15107 5C

RADIOACTIVE WASTES

Tritium Control Technology,
W73-14978 5G

RADIOACTIVITY

Biokinetics of Environmental Tritium,
W73-14962 5B

Studies on the Food Chain Contamination by Tritium,
W73-14963 5B

Guidance for Limiting Environmental Releases of Tritium,
W73-14968 5B

Transfer of Tritium from Methane to Vegetation,
W73-14969 5B

Considerations in the Assessment of the Consequences of Effluents from Mixed Oxide Fuel Fabrication Plants. Environmental Considerations Affecting Consequences of Releases,
W73-15241 5B

RADIOACTIVITY TECHNIQUES

Comparison of Radioactive Glasses of Scandium and Iridium as Tracers in Sediment-Transport Studies,
W73-14826 2J

Unreliability of the C-14 Method for Estimating Primary Productivity in Eutrophic Dutch Coastal Waters,
W73-15078 5A

Beryllum Uptake by the Common Guppy Using Radioisotope Be-7. I. Preliminary Study: Tracer Mechanics and Procedures,
W73-15135 5C

Beryllium Uptake by the Common Guppy Using Radioisotope Be-7. II. Beryllium Concentration in Fish,
W73-15136 5C

RADIOCHEMICAL ANALYSIS

A Method for the Determination of Strontium-90 and Cesium-137 in River Sediments and Soils,
W73-15245 5A

RADIOECOLOGY

Great Lakes Radioecology,
W73-15239 5B

Radiological and Environmental Research Division Annual Report,
W73-15246 5B

Feeding Rates and Food Utilization of Stream Caddisfly Larvae of the Genus Neophylax (Trichoptera:Limnephilidae) Using Cobalt-60 and Carbon-14,
W73-15252 5B

RADIOISOTOPES

The Effect of Sorption on the Migration of Be-7 From a High Energy Accelerator Constructed on a Chalk Site,
W73-14821 5B

Iaea Research Contracts, Thirteenth Annual Report.
W73-14960 5G

Field Spectrometric Measurements of Radionuclide Concentrations and External Gamma Exposure Rates at the Nevada Test Site, A Demonstration Study,
W73-15238 5B

Amchitka Radiobiological Program Progress Report for March 1972 to December 1972,
W73-15255 5B

RAINBOW TROUT

The Effects of Differently Extracted Endotoxins from Escherichia Coli on Rainbow Trout (Salmo Gairdneri),
W73-14769 5C

Toxicity of TFM (Lampricide) to Six Early Life Stages of Rainbow Trout (Salmo gairdneri),
W73-15096 5C

RAINFALL

Hypotheses on the Seasonal Distribution of Thunderstorm Rainfall in Southeastern Arizona,
W73-15036 2B

Temporal and Spatial Variation of Parameters for the Distribution of N-Day Precipitation,
W73-15073 2B

RAINFALL-RUNOFF RELATIONSHIPS

Hydrology of Seasonally Inundated African Headwater Swamps,
W73-14825 2A

Rainfall Excess Model from Soil Water Flow Theory,
W73-14836 2G

Relationship of Observed Rainfall and Runoff Recurrence Intervals,
W73-15032 2A

The Role of Lag in a Quasi-Linear Analysis of the Surface Runoff System,
W73-15037 2A

Analysis of Unitgraph Method of Flood Synthesis by Shallow Water Equations,
W73-15038 2A

Demonstration of Nonlinear Effects of a Second Order Surface Runoff Model by Field Data,
W73-15039 2A

Long Term Runoff Analysis by a Conceptual Physical Model,
W73-15042 2A

Some Methods for Estimation of Floods in a Tropical Area,
W73-15058 2E

Predictive Study on Urbanizing Effect of Drainage Basin on Flood Runoff,
W73-15061 4C

Flood Characteristics of the Ramu River, New Guinea,
W73-15063 2E

RAMAN SPECTRA

Raman Spectra and Structure of Water in Dimethyl Sulfoxide,
W73-14939 1B

RAPID SAND FILTRATION

Metropolitan District Water Supply System, Hartford, Connecticut: Design Features of the Water Treatment Plant at Reservoir Six,
W73-15206 5F

RARITAN BAY

Abundance, Distribution and Oil Biodegradation Potential of Microorganisms in Raritan Bay,
W73-15108 5C

RATIONAL FORMULA

Some Methods for Estimation of Floods in a Tropical Area,
W73-15058 2E

RATS

Comparison of the Metabolism of Parathion by Lobsters and Rats,
W73-15090 5C

REAERATION
Atmospheric Reaeration in Natural Streams,
W73-14896 5B

REAERATION COEFFICIENT
Atmospheric Reaeration in Natural Streams,
W73-14896 5B

REASONABLE USE
The Effects of Diminished Groundwater Supplies on Selected New Hampshire Industries,
W73-14766 4B

RECHARGE BASINS
Successions of Planktonic Organisms in Ground Water Recharge Basins Fed by River Water,
W73-15290 5G

RECLAIMED WATER
Recycle, What Disinfectant for Safe Water Then,
W73-14802 5D

Utility District Anticipates Future Water Needs,
W73-15023 6D

RECREATION
The Formulation of an Outdoor Recreation Supply Function,
W73-14768 6B

The Value of Reservoir Recreation,
W73-14775 6B

Water Quality Perception and the Recreational Uses of Green Bay, Lake Michigan,
W73-15024 5G

Participation and Expenditures for Hunting, Fishing and General Rural Outdoor Recreation in Arizona,
W73-15225 6B

RECREATION DEMAND
Public Investment Criteria for Water Oriented Recreation in the Lake Erie Basin,
W73-14774 6D

The Value of Reservoir Recreation,
W73-14775 6B

RECREATION SUPPLY FUNCTION
The Formulation of an Outdoor Recreation Supply Function,
W73-14768 6B

RECYCLING
White Water Reuse on a Fine-Paper Machine,
W73-14920 5D

Balance and Characteristics of Effluents from Recycling of Residual Fermentation Liquor (Balans i kharakteristika stochnykh vod pri vozvrate posledrozhzhevoi brazhki na gidroliz),
W73-14942 5D

Recycled Water Poses Disinfectant Problem.
W73-14943 5D

Sludge Recycling: The Most Reasonable Choice,

Radiological and Environmental Research Division Annual Report,
W73-15246 5B

RESERVOIR CONSTRUCTION
Problems of Reservoir Construction and Complex Use in the USSR (Problemy sozdaniya i kompleksnogo ispol'zovaniya vodokhranilishch v SSSR),
W73-14851 8A

RESERVOIR DESIGN
Problems of Reservoir Construction and Complex Use in the USSR (Problemy sozdaniya i kompleksnogo ispol'zovaniya vodokhranilishch v SSSR),
W73-14851 8A

Prediction of Reservoir Filling for Streams Subject to Erratic Floods,
W73-15043 4A

Simulation Model for the Decision Between Dilution or Sewage Treatment During Droughts,
W73-15067 5G

RESERVOIR EVAPORATION
Modeling and Simulation of Reservoirs to Predict Evaporation Reduction by Surface Films,
W73-14868 3B

RESERVOIR OPERATION
Problems of Reservoir Construction and Complex Use in the USSR (Problemy sozdaniya i kompleksnogo ispol'zovaniya vodokhranilishch v SSSR),
W73-14851 8A

Planning the Development of the Nestos River,
W73-14907 4A

Multilake River System Operation Rules,
W73-14909 4A

Practical Decision Rules in Reservoir Operation,
W73-15044 4A

Flood Control Policies Developed by Simulation,
W73-15047 4A

RESERVOIR SILTING
Sedimentation in Mangla Reservoir,
W73-14845 2J

RESERVOIR STORAGE
Utilisation of Disused Coal Mines as Water Storage Reservoirs,
W73-14827 4B

RESERVOIR YIELD
Practical Decision Rules in Reservoir Operation,
W73-15044 4A

RESERVOIRS
The Formulation of an Outdoor Recreation Supply Function,
W73-14768 6B

Problems of Reservoir Construction and Complex Use in the USSR (Problemy sozdaniya i kompleksnogo ispol'zovaniya vodokhranilishch v SSSR),
W73-14851 8A

Control of Reservoir Eutrophication,
W73-14886 5G

Specific Character of the Structure and Dynamics of Reservoir Water Masses (O spetsifichnosti struktury i dinamiki vodnykh mass vodokhranilishch),
W73-15008 2H

Gillham Lake, Cossatot River, Arkansas, Appendix 1, Correspondence (Final Environmental Impact Statement).
W73-15137 4A

Meandering Rights for Contracted Water,
W73-15143 6E

Iron, Manganese, Cobalt, and Zinc Cycles in a South Carolina Reservoir,
W73-15251 5B

RESISTIVITY
Calculation of Water Quality from Electrical Logs Theory and Practice,
W73-15193 2K

RESOURCE ALLOCATION
Social/Environmental Systems for Regional Development Planning,
W73-14860 6B

RESOURCES DEVELOPMENT
Financing Alternatives for Regional Resource Development,
W73-14861 6B

RETENTION
Waste Water Clarification in the Paper Industry Through Modern Retention Aids (Abwasserklaerung in der Papierindustrie durch moderne Retentionsmittel),
W73-14935 5D

RETURN FLOW
Soil Bacteria in Land-Drainage Water,
W73-14823 5B

REVERSE OSMOSIS
Reverse Osmosis Concentration of Spent Liquor Solids in Press Liquors from High-Density Pulps,
W73-14923 5D

REVIEWS
Testing of Methods for Determination of Urban Runoff,
W73-14835 4A

The Ecology of the Southern California Bight: Implications for Water Quality Management.
W73-14914 5C

Water Quality Criteria for European Freshwater Fish. Report on Monohydric Phenols and Inland Fisheries,

Tubificids and Water Quality: A Review,
W73-15109 5C

Columbia River Thermal Effects Study: Reactor Effluent Problems,
W73-15118 5C

Toxicology of Pesticides: Recent Advances,
W73-15126 5C

RHIZOCTONIA SOLANI
Location, Identification, and Characterization of Pathogens of the Water Hyacinth,
W73-14758 5C

RHODE ISLAND
New Fluorescent Tracer Detection Techniques for use in Polluted Environments,
W73-14770 5B

Method for Estimating the Diversion Potential of Streams in Eastern Massachusetts and Southern Rhode Island,
W73-14994 2E

Municipal Sewage Treatment Systems--Inventory of the Structure and Functions of Rhode Island's Public Sewage Treatment Systems.
W73-15200 5D

RHODE ISLAND (ANNAQUATUCKET RIVER)
Correlations Between Alewife Activity and Environmental Variables at a Fishway,
W73-15297 8I

RHODOPHYTA
Morphology and Development of a New Alga, Haloplegma Anwerii (Ceramiaceae) from Karachi Coast,
W73-15133 5A

RICE CULTIVATION
Rice Cultivation in Southern Kazakhstan Kzylkumsky Ridge, (In Russian),
W73-15283 3F

RIPARIAN RIGHTS
Meandering Rights for Contracted Water,
W73-15143 6E

RIPPLE MARKS
Pebble Segregation and Bed Lenticularity in Wave-Worked Versus Alluvial Gravel,
W73-15263 2J

RISKS
Reliability of Estimates of the Exceedence Probability of a Given Flood Magnitude,
W73-15051 2E

Risks From Using Inadequate Flood Records,
W73-15053 2E

Stochastic Model of Flood Risk Evaluation,
W73-15054 2A

Analysis of Risks and Uncertainties in Flood Control,
W73-15056 4A

RIVER BASINS
Simulation of the Quantity and Quality of Flow in a River Basin,
W73-14765 2A

Quantitative Hydrologic Study of a Closed Basin with a Playa (Estancia Valley, New Mexico),
W73-14767 2A

Planning the Development of the Nestos River,
W73-14907 4A

Tarbela Dam Project, Pakistan,
W73-15211 8A

RIVER CHANNEL PATTERNS
Theories and Relationships of River Channel Patterns,
W73-14833 2E

RIVER SYSTEMS
Multilake River System Operation Rules,
W73-14909 4A

Gillham Lake, Cossatot River, Arkansas, Appendix IV, Appendix V, Appendix VI (Final Environmental Impact Statement).
W73-15138 4A

RIVERS
Role of the Organic Matter of a Waterway with Regard to Radioactive Pollution (Influence Des Conditions D'Extraction Sur Le Fractionnement Comportement Des Elements Chimiques Vis-A-Vis De La Matiere Organique),
W73-15244 5B

ROSS ISLAND
The Occurrence and Distribution of some Aquatic Phycomycetes on Ross Island and the Dry Valleys of Victoria Land, Antarctica,
W73-15120 5B

ROUGHNESS (HYDRAULIC)
Changes in Floodflow Characteristics of a Rectified Channel Caused by Vegetation, Jackson, Mississippi,
W73-14995 2E

ROUTING
Watershed Flood Routing Using Distributed Parameters,
W73-15059 2E

RUNOFF
Patterns of Variability of River Runoff as a Basis for a Theory of its Regulation and Use (Zakonomernosti kolebaniy rechnogo stoka kak osnova teorii yego regulirovaniya i ispol'zovaniya),
W73-15010 4A

RUNOFF FORECASTING
Hypotheses on the Seasonal Distribution of Thunderstorm Rainfall in Southeastern Arizona,
W73-15036 2B

Stochastic Structures in Space and Time of Daily Precipitation and Their Simulation,
W73-15074 2E

SALINE LAKE RECOVERY
Aspects of the Recovery of a Saline African Lake Following A Dry Period,
W73-15296 2H

SALINE WATER
Prospects of Increasing Freshwater Resources in the USSR Through Desalting of Saline and Brackish Waters (Perspektivy uvelicheniya re-

sursov presnykh vod na territorii SSSR za schet opresneniya solenykh i solonovatykh vod),
W73-14854 3A

SALINE WATER INTRUSION
Salt-Water Movement in the Lower Withlacoochee River--Cross-Florida Barge Canal Complex,
W73-14808 8B

Minimum Length of Salt Intrusion in Estuaries,
W73-14842 2L

SALINITY
Effects of Development on Salinity and Limnology of the Lower Colorado River,
W73-14756 5C

Remote Measurement of Salinity in an Estuarine Environment,
W73-15001 2L

Salinity, Plant Growth, and Metabolism,
W73-15218 3C

SALINITY DISCONTINUITY LAYERS
Behavior of the Planktonic Coelenterates, Sarsia Tubulosa, Phialidium Gregarium, and Pleurobrachia Pileus in Salinity Discontinuity Layers,
W73-15098 5C

SALMON
Yolk-Sac Malformation in Pacific Salmon in Relation to Substrate, Temperature, and Water Velocity,
W73-15102 5C

SALMONIDS
Columbia River Thermal Effects Study: Reactor Effluent Problems,
W73-15118 5C

SALT DEPOSITS
Geologic Appraisal of Paradox Basin Salt Deposits for waste Emplacement,
W73-14820 5B

SALT MARSHES
Summary of a Report to the Santa Clara County Flood Control and Water District on the Baylands Salt Water Flood Control Planning Study.
W73-15020 4A

SALT TOLERANCE
Salt Tolerance and Cation Interaction in Alkali Sacaton at Germination,
W73-15215 3C

SALTATION
Basic Patterns in Movement of Fluvial Sediments (Osnovnyye zakonomernosti dvizheniya rechnykh nanosov),
W73-14850 2J

SAMPLE PREPARATION
A Rapid Method for Clearing Diatoms From Taxonomic and Ecological Studies,
W73-15115 5A

SAMPLING
Analysis of High-Purity Water by Flameless Atomic Absorption Spectroscopy. I. The Use of an Automated Sampling System,
W73-14955 5A

Laboratory System for Tritium Analysis of Large Numbers of Environmental Samples,
W73-14973 5B

Sampling Bias of a Longhurst-Hardy Plankton Recorder,
W73-15080 7B

A Messenger-Operated Closing Trawl,
W73-15081 7B

SAN FRANCISCO BAY (CALIF.)
A Study of Toxicity and Biostimulation in San Francisco Bay-Delta Waters, Volume III, Acute Toxicity of Discharged Wastes,
W73-14878 5C

A Study of Toxicity and Biostimulation in San Francisco Bay-Delta Waters, Volume VII, Effects of Selected Waste Discharges on Benthic Invertebrate Communities,
W73-14880 5C

SAN FRANCISCO BAY-DELTA (CALIF.)
A Study of Toxicity and Biostimulation in San Francisco Bay-Delta Waters, Volume I, Summary Report,
W73-14876 5C

A Study of Toxicity and Biostimulation in San Francisco Bay-Delta Wasters, Volume II, A Statistical Evaluation of the Relationship between Toxicity and Species Diversity Index.
W73-14877 5C

A Study of Toxicity and Biostimulation in San Francisco Bay-Delta Waters, Volume VI, Bioassays of Lower Trophic Levels,
W73-14879 5C

A Study of Toxicity and Biostimulation in San Francisco Bay-Delta Waters, Volume VIII, Algal Assays of Selected Waste Discharges,
W73-14881 5C

SAN LUIS WATERSHED (N. MEX)
Vegetation Changes as a Result of Soil Ripping on the Rio Puerco in New Mexico,
W73-15213 4D

SANGAMON RIVER BASIN (ILL)
Analysis of Multiple-Input Stochastic Hydrologic Systems,
W73-14753 2A

SANITARY PROBLEMS
Sanitary Problems of the Water Supply of Rural Settlements of the North Dagestan Lowlands and Measures for their Rational Use, (In Russian),
W73-15139 4B

SANTA BARBARA BASIN (CALIF)
Mercury Concentrations in Dated Varved Marine Sediments Collected Off Southern California,
W73-14937 5B

SANTA CLARA COUNTY (CALIF.)
Summary of a Report to the Santa Clara County Flood Control and Water District on the Baylands Salt Water Flood Control Planning Study.
W73-15020 4A

SAPROPHYTES
Contamination of Water Bodies and Biological Assessment of Water Quality (Zagryazneniye vodoyemov i biologicheskaya otsenka kachestva vod),
W73-15007 5C

SATELLITES (ARTIFICIAL)
Suspended Sediment Observations from ERTS-1,
W73-15002 2L

SATURATED SOILS
Water-Balance Studies and Calculations in Regulation of the Moisture Regime of Excessively Wet Reclaimed Soils (Vodnobalansovyye issledovaniya i raschety pri regulirovanii rezhima uvlazheniya meliorriuyemykh izbytochno-uvlazhnennykh zemel'),
W73-15011 2G

SAVANNAH (GEO.)
A Plan for Water and Sewer, (Chatham County - Savannah).
W73-15199 5G

SAVO PROCESS
The 'Savo' Method Treats Industrial Process Water.
W73-14933 5D

SCALING
Treatment of Soda Recovery Boiler Feedwater with Trilon (Trilonnaya obrabotka kotlovoi vody sodregeneratsionnykh agregatov),
W73-14949 5D

SCANDIUM RADIOISOTOPES
Comparison of Radioactive Glasses of Scandium and Iridium as Tracers in Sediment-Transport Studies,
W73-14826 2J

SCENEDESMUS
Growth of Dictyosphaerium, Selenastrum, and Scenedesmus (Chlorophyceae) in a Dilute Algal Medium,
W73-15116 5C

SCENEDESMUS QUADRICAUDA
Sensitivity of Dunaliella and Scenedesmus (Chlorophyceae) to Chlorinated Hydrocarbons,
W73-15114 5C

SCIENTIFIC PERSONNEL
Directory of Water Resources Research Faculty at University of Minnesota and State and Private Colleges in Minnesota,
W73-14862 6A

SEA ICE
Statistical Comparison of Airborne Laser and Stereophotogrammetric Sea Ice Profiles,
W73-14999 2C

SEA LEVEL
A Chenier Sequence at Broad Sound, Queensland, and Evidence Against a Holocene High Sea Level,
W73-14815 2L

SEA WATER
Spectrophotometric Determination of Vanadium in Sea Water,
W73-14950 5A

A Neutron Activation Procedure for the Determination of Dissolved Silver in Sea Water,
W73-14951 5A

SEASHORE
Summary of a Report to the Santa Clara County Flood Control and Water District on the Baylands Salt Water Flood Control Planning Study.
W73-15020 4A

SEASONAL VARIATION
Seasonal Fluctuations of Aquatic Macroinvertebrates in Oakwood Bottoms Greentree Reservoir,
W73-15209 5C

SECONDARY RECOVERY (GAS)
Transfer of Tritium from Methane to Vegetation,
W73-14969 5B

SEDIMENT CONTROL
Tarbela Dam Project, Pakistan,
W73-15211 8A

SEDIMENT SORTING
Pebble Segregation and Bed Lenticularity in Wave-Worked Versus Alluvial Gravel,
W73-15263 2J

SEDIMENT TRANSPORT
Suspended Sediment Transport From the Gironde Estuary (France) Onto the Adjacent Continental Shelf,
W73-14813 2L

The Bottom Sediments of the Amazon Shelf and Tropical Atlantic Ocean,
W73-14814 2J

Comparison of Radioactive Glasses of Scandium and Iridium as Tracers in Sediment-Transport Studies,
W73-14826 2J

Basic Patterns in Movement of Fluvial Sediments (Osnovnyye zakonomernosti dvizheniya rechnykh nanosov),
W73-14850 2J

Changes in Foreshore Sand Volume on a Tidal Beach: Role of Fluctuations in Water Table and Ocean Still-Water Level,
W73-14988 2F

Synoptic Measurements of Currents and Sediment Transport on the Continental Shelf, (Annual Progress Report),
W73-15242 5B

Sedimentary Environments of the East-Central Bering Sea Continental Shelf,
W73-15267 2J

SEDIMENTARY STRUCTURES
Textural Trend Analysis of Coastal Barrier Sediments Along the Middle Atlantic Bight, North Carolina,
W73-14810 2J

Features of Cross-Stratified Units Due to Random and Other Changes in Bed Forms,
W73-15259 2J

Pebble Segregation and Bed Lenticularity in Wave-Worked Versus Alluvial Gravel,
W73-15263 2J

SEDIMENTATION
Textural Trend Analysis of Coastal Barrier Sediments Along the Middle Atlantic Bight, North Carolina,
W73-14810 2J

Marine Geology of the Aleutian Abyssal Plain,
W73-14811 2J

A Chenier Sequence at Broad Sound, Queensland, and Evidence Against a Holocene High Sea Level,
W73-14815 2L

History and Sand Budgets of the Barrier Island System in the Panama City, Florida, Region,
W73-14818 2L

Sedimentation in Mangla Reservoir,
W73-14845 2J

Features of Cross-Stratified Units Due to Random and Other Changes in Bed Forms,
W73-15259 2J

Sedimentary Environments of the East-Central Bering Sea Continental Shelf,
W73-15267 2J

No Current Reversal at 10,000 B.P. In the Strait of Gibraltar,
W73-15273 2E

SEDIMENTATION RATES
Sedimentation in Mangla Reservoir,
W73-14845 2J

The Use of Natural and Fallout Radionuclides to Measure Recent Sedimentation Rates in Southern Lake Michigan,
W73-15240 5B

SEDIMENTS
Mercury Concentrations in Dated Varved Marine Sediments Collected Off Southern California,
W73-14937 5B

Role of Organic Materials in a Water Course with Respect to Radioactive Contamination. Method of Extraction, Fractionation and Identification by Spectroscopy and Their Affinity to Radionuclides,
W73-14982 5B

Role of the Organic Matter of a Waterway with Regard to Radioactive Pollution (Influence Des Conditions D'Extraction Sur Le Fractionnement Comportement Des Elements Chimiques Vis-A-Vis De La Matiere Organique),
W73-15244 5B

Mercury Concentrations in Sediments of the Lake Erie Basin, Ohio.
W73-15260 5B

SEEPAGE
Seepage Into Sheet Pile Cofferdam,
W73-14843 8B

SELENASTRUM
Growth of Dictyosphaerium, Selenastrum, and Scenedesmus (Chlorophyceae) in a Dilute Algal Medium,
W73-15116 5C

SELENIUM
Uptake of Selenium by Aquatic Organisms,
W73-15079 5B

SELF-PURIFICATION
Atmospheric Reaeration in Natural Streams,
W73-14896 5B

Twenty-Fifth Hydrochemistry Conference (XXV Gidrokhimicheskoye soveshchaniye),
W73-15016 2A

Successions of Planktonic Organisms in Ground Water Recharge Basins Fed by River Water,
W73-15290 5G

SEMIARID CLIMATES
Ecological Investigation of Radioactive Materials in Waste Discharge Areas at Los Alamos for the Period July 1, 1972 - March 31, 1973,
W73-14981 5B

SENSITIVITY
Sensitivity of Dunaliella and Scenedesmus (Chlorophyceae) to Chlorinated Hydrocarbons,
W73-15114 5C

SEPARATION TECHNIQUES
Method of Recovering Oil from a Water Surface,
W73-14777 5G

SEQUENCING
Optimal Sequencing of Capacity Expansion Projects,
W73-14912 6A

SEQUOIA (GIANT)
Determination of XYLEM Tensions in the Crown of a Giant Sequoia: Sequoiadendron giganteum,
W73-15279 2I

SEWAGE BACTERIA
Toxic Effects of Color Photographic Processing Wastes on Biological Systems,
W73-14893 5C

SEWAGE DISPOSAL
Florida Courts and Water Pollution: A Floating Crap Game,
W73-15152 6E

SEWAGE EFFLUENTS
Muskegon Sprays Sewage Effluents on Land,
W73-14884 5D

SEWAGE TREATMENT
Overflow Arrangement,
W73-14778 5D

Filter Press, More Particularly for Dewatering Sludge in Sewage Treatment Plants,
W73-14779 5D

Florida Courts and Water Pollution: A Floating Crap Game,
W73-15152 6E

Municipal Sewage Treatment Systems--Inventory of the Structure and Functions of Rhode Island's Public Sewage Treatment Systems.
W73-15200 5D

Treatment and Disposal of Industrial Wastewaters,
W73-15205 5D

Metropolitan District Water Supply System, Hartford, Connecticut: Design Features of the Water Treatment Plant at Reservoir Six,
W73-15206 5F

The Water Reclamation Works at Windhoek (South West Africa),
W73-15214 5D

SEWARD COUNTY (NEB)
Use of Ground Water for Irrigation in Seward County, Nebraska in 1971,
W73-14997 4B

SEWERAGE
Sewerage and Sewage Disposal: Administrative and Technical Principles,
W73-15029 5G

Comprehensive Area-Wide Water and Wastewater Facilities Plan and Program for the Mid-Cumberland Region of Tennessee.
W73-15196 6B

Water and Sewerage Development Plan, Kansas City Metropolitan Region.
W73-15198 5G

A Plan for Water and Sewer, (Chatham County - Savannah).
W73-15199 5G

SEWERAGE

Preliminary Sewer Study, Vredenburgh, Alabama,
W73-15204 5D

SEWERS
Preliminary Sewer Study, Vredenburgh, Alabama,
W73-15204 5D

SEYSTEMATICS
Microfungi Colonizing Collapsed Aerial Parts of Phragmites Communis Trin. in Water,
W73-15132 5C

SHAD
The Behavior of Adult American Shad (Alosa Sapidissima) During Migration from Salt to Fresh Water as Observed by Ultrasonic Tracking Techniques,
W73-14953 8I

SHAD (THREADFIN)
A Midwater Trawl for Threadfin Shad, Dorosoma petenense,
W73-15288 2H

SHEET PILING
Seepage Into Sheet Pile Cofferdam,
W73-14843 8B

SHINERS
Effect of SKF-525A on Brain Acetylcholinesterase Inhibition by Parathion in Fishes,
W73-15119 5C

SHRUBS
Productivity of an Arid Zone Shrub (Eremophila gilesii) Community in South-Western Queensland,
W73-15219 2I

SIEVE (ROTARY)
A Rotary Sieve for Removing Mud From Bottom Deposit Samples,
W73-15210 7B

SILVER
A Neutron Activation Procedure for the Determination of Dissolved Silver in Sea Water,
W73-14951 5A

SIMULATION ANALYSIS
Simulation of the Quantity and Quality of Flow in a River Basin,
W73-14765 2A

Log-Normal Streamflow Generation Models Reexamined,
W73-14838 2A

Planning the Development of the Nestos River,
W73-14907 4A

Simulation in Watershed Planning,
W73-14910 4A

Simulation and Optimization of Acid Mine Drainage Abatement Alternatives,
W73-14913 5G

Flood Control Policies Developed by Simulation,
W73-15047 4A

Reliability of Estimates of the Exceedence Probability of a Given Flood Magnitude,
W73-15051 2E

A Note on the Generation of Gamma Random Variables with Non-Integral Shape Parameter,
W73-15071 7C

Stochastic Structures in Space and Time of Daily Precipitation and Their Simulation,
W73-15074 2E

SINKS
Bottom Withdrawal of Viscous Stratified Fluid,
W73-14837 4A

SITE SELECTION
Climate and the Selection of a Beef Waste Management System,
W73-15183 5D

SITES
Final Environmental Statement Related to Operation of Enrico Fermi Atomic Power Plant - Unit 2.
W73-14979 5B

Final Environmental Statement Related to Operation of Duane Arnold Energy Center.
W73-14980 5B

Final Environmental Statement Related to Operation of Virgil C. Summer Nuclear Station Unit 1.
W73-15235 5B

Final Environmental Statement Related to Operation of Quad-Cities Nuclear Power Station Units 1 and 2.
W73-15236 5B

Final Environmental Statement Related to Operation of Cooper Nuclear Station.
W73-15237 5B

Final Environmental Statement Related to Operation of Turkey Point Plant, Units 3 and 4.
W73-15243 5B

Final Environmental Statement Related to the Prairie Island Nuclear Generating Plant.
W73-15256 5C

SIZE
Growth and Cell-Size Distribution of Marine Planktonic Algae in Batch and Dialysis Cultures,
W73-15128 5C

Interregional Competition in the Cattle Feeding Economy, with Special Emphasis on Economies of Size,
W73-15184 3F

SKELLYSOLVE F
Antimicrobial Effects of Aquatic Plants From Minnesota,
W73-15228 5C

SKF-525A
Effect of SKF-525A on Brain Acetylcholinesterase Inhibition by Parathion in Fishes,
W73-15119 5C

SLOPES
The Influence of Slope Orientation Upon the Soil Moisture Regime, and Its Hydrogeomorphological Significance,
W73-14831 2G

Validity of Dupuit-Forchheimer Equation,
W73-14844 2F

SLOTTED FLOORS
Equipment and Facilities for Modern Methods of Swine Manure Disposal,
W73-15180 5D

SLUDGE
Investigation of Heavy Metal-Sludge Complexation constants by Cation Exchange,
W73-14783 5B

SLUDGE TREATMENT
Filter Press, More Particularly for Dewatering Sludge in Sewage Treatment Plants,
W73-14779 5D

SMITH MOUNTAIN LAKE (VA)
A Computer-Implemented Instructional Game for Evaluating Water Management Alternatives,
W73-14772 6B

SNAKE RIVER
Impacts of Water-Resource Development in the Snake River Area on Wildlife,
W73-14773 6G

SOCIAL PARTICIPATION
Participation and Expenditures for Hunting, Fishing and General Rural Outdoor Recreation in Arizona,
W73-15225 6B

SOFT WATER LAKES
Hydrographical Data from 2 Soft Water Lakes with Special Reference to Preciptiation (Melt Water),
W73-15299 2H

SOFTWOOD
On Spent Semichemical Pulping Liquors. (I). Species Variation of Pulping Timbers Color and Chemical Oxygen Demand, (In Japanese),
W73-15189 5B

SOIL ALGAE
Blue-Green Algal Flora of Rajasthan,
W73-15130 5C

SOIL ANALYSIS
The Emerson Dispersion Test and Its Relationship to Hydraulic Conductivity,
W73-15222 2G

SOIL BACTERIA
Soil Bacteria in Land-Drainage Water,

SOIL CONTAMINATION
Environmental Tritium,
W73-14966 5B

The Behavior of Tritium in the Soil,
W73-14970 5B

Forced Exchange of Tritiated Water with Clays,
W73-14971 5B

Absence of Acute Effects on Threespine Sticklebacks (Gasterosteus aculeatus) and Coho Salmon (Oncorhynchus kisutch) Exposed to Resuspended Harbor Sediment Contaminants,
W73-15095 5C

Animal Waste Disposal and Control of Feedlot Runoff.
W73-15231 5D

Pacific Northwest Laboratory Annual Report for 1972. Volume II: Physical Sciences, Part 1. Atmospheric Sciences,
W73-15233 5B

Method for the Determination of Strontium- and Cesium-137 in River Sediments and ils,
73-15245 5A

L CONTAMINATION EFFECTS
mbleweed and Cheatgrass Uptake of ansuranium Elements Applied to Soil as Or- nic Acid Complexes,
73-14975 5B

L FUNGI
quatic Fungi from an Antarctic Island and a opical Lake,
73-15134 5C

L MANAGEMENT
egetation Changes as a Result of Soil Ripping the Rio Puerco in New Mexico,
73-15213 4D

L MICROORGANISMS
oil Surface Lichens in Arid and Subarid outheastern Australia. III: The Relationship etween Distribution and Environment,
73-15258 2G

L MOISTURE
he Influence of Slope Orientation Upon the oil Moisture Regime, and Its ydrogeomorphological Significance,
73-14831 2G

eforestation Effects on Soil Moisture, treamflow, and Water Balance in the Central ppalachians,
73-14919 4D

Vater-Balance Studies and Calculations in egulation of the Moisture Regime of Exces- ively Wet Reclaimed Soils (Vodnobalansovyye ssledovaniya i raschety pri regulirovanii ezhima uvlazheniya melioriruyemykh iz- ytochno-uvlazhnennykh z emel'),
73-15011 2G

Generalized Hydrologic Modeling, A Key to Drought Analysis,
73-15065 2G

IL PHYSICAL PROPERTIES
The Emerson Dispersion Test and Its Relation- hip to Hydraulic Conductivity,
73-15222 2G

IL RIPPING
Vegetation Changes as a Result of Soil Ripping on the Rio Puerco in New Mexico,
73-15213 4D

IL WATER
Some Effects of Soil Water Tables on the Growth of Sitka Spruce in Northern Ireland,
73-14898 2I

Soil Water Content Beneath Summer-Dormant and Summer-Active Swards in a Seasonally Semi-Arid Environment,
73-15169 2D

IL WATER MOVEMENT
The Influence of Slope Orientation Upon the Soil Moisture Regime, and Its Hydrogeomorphological Significance,
73-14831 2G

Rainfall Excess Model from Soil Water Flow Theory,
73-14836 2G

Water Table Control with Subsurface Irrigation,
73-14858 3F

Dynamic Model of Water Movement in Soil Under Various Climatological Conditions,
73-14972 5B

SOILS (SLOPES)
Some Observations on Soils-Microclimate Interactions,
73-15292 2G

SORGHUM
Diurnal Water Stress in Plants Grown on a Coarse Soil,
73-15216 3F

SORGHUM-BICOLOR
Stomatal Resistance, Net Photosynthesis and Transpiration in PMA-Treated Sorghum: A Field Study,
73-15300 3F

SORPTION
The Effect of Sorption on the Migration of Be-7 From a High Energy Accelerator Constructed on a Chalk Site,
73-14821 5B

SOUNDING
Observations of Shallow Layering Utilizing the Pingerprobe Echo-Sounding System,
73-14812 2J

SOUTH AMERICA
The Bottom Sediments of the Amazon Shelf and Tropical Atlantic Ocean,
73-14814 2J

SOUTH CAROLINA
Final Environmental Statement Related to Operation of Virgil C. Summer Nuclear Station Unit 1.
73-15235 5B

Iron, Manganese, Cobalt, and Zinc Cycles in a South Carolina Reservoir,
73-15251 5B

SOUTHERN CALIFORNIA BIGHT
The Ecology of the Southern California Bight: Implications for Water Quality Management.
73-14914 5C

SOUTHWEST AFRICA (WINDHOEK)
The Water Reclamation Works at Windhoek (South West Africa),
73-15214 5D

SOYBEAN ROOT SYSTEM
The Effect of Drought, Irrigation and Mineral Fertilization on the Growth of the Root System of Soybean plants, (In Russian),
73-15285 3F

SPECIATION
Blue-Green Algal Flora of Rajasthan,
73-15130 5C

SPECIES DENSITY
Seasonal Fluctuations of Aquatic Macroinvertebrates in Oakwood Bottoms Greentree Reservoir,
73-15209 5C

SPECIES DIVERSITY
Phytoplankton Organization in Baie Des Chaleurs (Gulf of St Lawrence),
73-15111 2L

Seasonal Fluctuations of Aquatic Macroinvertebrates in Oakwood Bottoms Greentree Reservoir,
73-15209 5C

SPECIES DIVERSITY INDEX
A Study of Toxicity and Biostimulation in San Francisco Bay-Delta Wasters, Volume II, A Statistical Evaluation of the Relationship between Toxicity and Species Diversity Index.
73-14877 5C

SPECIFIC CONDUCTANCE
Calculation of Water Quality from Electrical Logs Theory and Practice,
73-15193 2K

SPECTROPHOTOMETRY
The Izaa Sprectrometer: A Detector for Trace Elements in Gases, Liquids, and Soils,
73-14785 2K

Determination of Trace Quantities of Arsenic in Wastewaters by Carbon Rod Atomic Absorption Spectrometry,
73-14786 5A

SPECTROSCOPY
Raman Spectra and Structure of Water in Dimethyl Sulfoxide,
73-14939 1B

SPILLWAYS
Flood Control in Reservoirs and Storage Pounds,
73-14832 4A

SPRINGS
Gibbs V. Wright (Action to Determine Right to Obtain Water from Spring),
73-15160 6E

SPRINKLER IRRIGATION
Muskegon Sprays Sewage Effluents on Land,

Method and Means for the Water Transport of Liquids,
W73-14780 5G

TRANSURANIUM ELEMENTS

Tumbleweed and Cheatgrass Uptake of Transuranium Elements Applied to Soil as Organic Acid Complexes,
W73-14975 5B

TRAWL

A Midwater Trawl for Threadfin Shad, Dorosoma petenense,
W73-15288 2H

TREATMENT FACILITIES

Reverse Osmosis Concentration of Spent Liquor Solids in Press Liquors from High-Density Pulps,
W73-14923 5D

The 'Savo' Method Treats Industrial Process Water.
W73-14933 5D

Method for Purification and Disinfection of Surface Waters by Means of Low-Frequency Alternating Current (Metoda Pentru Epurarea si Dezinfectarea Apelor de Suprafata cu Ajutorul Curentului Alternativ de Joasa Frecvent a),
W73-14957 5F

Oji (Paper Co.), Kasugai Mill Positively Grappling With Environmental Problem,
W73-14958 5D

Kamloops Pollution Curbs are B.C.'S Most Extensive.
W73-14959 5D

Comprehensive Area-Wide Water and Wastewater Facilities Plan and Program for the Mid-Cumberland Region of Tennessee.
W73-15196 6B

Metropolitan District Water Supply System, Hartford, Connecticut: Design Features of the Water Treatment Plant at Reservoir Six,
W73-15206 5F

Pollution of Water,
W73-15207 5D

TREND ANALYSIS

Textural Trend Analysis of Coastal Barrier Sediments Along the Middle Atlantic Bight, North Carolina,
W73-14810 2J

TRIBUTARIES

Mercury Concentrations in Sediments of the Lake Erie Basin, Ohio.
W73-15260 5B

TRICKLE IRRIGATION

Automated Irrigation is Here,
W73-15212 3F

TRICKLING FILTERS

Wastewater Disinfection of Trickling Filter Effluent with Bromine and Chlorine,
W73-14794 5D

Inclined-Plane Trickling Filter for Swine Waste,
W73-15179 5D

TRILON B

Treatment of Soda Recovery Boiler Feedwater with Trilon (Trilonnaya obrabotka kotlovoi vody sodregeneratsionnykh agregatov),
W73-14949 5D

TRITIUM

Biokinetics of Environmental Tritium,
W73-14962 5B

Studies on the Food Chain Contamination by Tritium,
W73-14963 5B

Behavior of Tritium in Fish Following Chronic Exposure,
W73-14964 5C

Tritium in the Atmosphere and Ocean,
W73-14965 5B

Environmental Tritium,
W73-14966 5B

The Dose to Man via Food-Chain Transfer Resulting from Exposure to Tritiated Water Vapor,
W73-14967 5C

Guidance for Limiting Environmental Releases of Tritium,
W73-14968 5B

Transfer of Tritium from Methane to Vegetation,
W73-14969 5B

The Behavior of Tritium in the Soil,
W73-14970 5B

Forced Exchange of Tritiated Water with Clays,
W73-14971 5B

Dynamic Model of Water Movement in Soil Under Various Climatological Conditions,
W73-14972 5B

Laboratory System for Tritium Analysis of Large Numbers of Environmental Samples,
W73-14973 5B

Tritium Uptake and Loss in Grass Vegetation When Exposed to an Atmospheric Source of Tritiated Water,
W73-14976 5B

Tritium Control Technology,
W73-14978 5G

Sources of Tritium and Its Behavior Upon Release to the Environment,
W73-15234 5B

An Apparatus for the Reduction of Tritium Emissions into the Atmosphere,
W73-15257 5G

TROPHIC CATEGORIES

Aquatic Macrophytes as Limnological Indicators,
W73-15298 5C

TROPHIC LEVEL

A Study of Toxicity and Biostimulation in San Francisco Bay-Delta Waters, Volume VI, Bioassays of Lower Trophic Levels,
W73-14879 5C

TROPICAL REGIONS
Wax Esters in Tropical Zooplankton and Nekton and the Geographical Distribution of Wax Esters in Marine Copepods,
W73-15117 5B

TUBIFICIDS
Tubificids and Water Quality: A Review,
W73-15109 5C

TUCKER TRAWL
A Messenger-Operated Closing Trawl,
W73-15081 7B

TULAROSA VALLEY (N. MEX)
Another Rio Grande for New Mexico,
W73-15232 3A

TURBIDITY
Remote Sensing of Turbidity Plumes in Lake Ontario,
W73-14993 2H

Suspended Sediment Observations from ERTS-1,
W73-15002 2L

TURBIDITY CURRENTS
Synoptic Measurements of Currents and Sediment Transport on the Continental Shelf, (Annual Progress Report),
W73-15242 5B

Storm-Generated Current in La Jolla Submarine Canyon, California,
W73-15268 2E

TURTLES
Occurrence of Radionuclides in the Exoskeleton of Turtles,
W73-15249 5B

UGANDA
Some Desmids from Uganda,
W73-15208 5C

UGANDA (LAKE GEORGE)
Aquatic Fungi from an Antarctic Island and a Tropical Lake,
W73-15134 5C

ULTRASONIC TRACKING
The Behavior of Adult American Shad (Alosa Sapidissima) During Migration from Salt to Fresh Water as Observed by Ultrasonic Tracking Techniques,
W73-14953 8I

ULTRASTRUCTURE
Light and Electron Microscope Studies of Diatom Species Belonging to the Genus Chaetoceros Ehrenberg. I. Chaetoceros Septentrionale Oestrup,
W73-15113 5A

UNDERGROUND STORAGE
Utilisation of Disused Coal Mines as Water Storage Reservoirs,
W73-14827 4B

Lerro V. Thomas Wynne, Inc. (Action by Property Owners Through Whose Property Creek Flowed and Who were Affected by Presence of Fuel Oil in the Creek).
W73-15157 6E

UNIT HYDROGRAPHS
Analysis of Unitgraph Method of Flood Synthesis by Shallow Water Equations,
W73-15038 2A

Removal of Unit Hydrograph Oscillations by Filtering,
W73-15040 2E

UNITED KINGDOM (ENGLAND-WALES)
Control of Water Resources Quality: Administrative Aspects,
W73-15028 5G

Sewerage and Sewage Disposal: Administrative and Technical Principles,
W73-15029 5G

UNITED NATIONS
Man and the Environment, A Bibliography of Selected Publications of the United Nations System, 1946-1971.
W73-14974 5C

UNITED STATES
Evaluating Federal Water Projects: A Critique of Proposed Standards,
W73-14926 6A

Control of Sulphite Pulping Wastes in the United States,
W73-14929 5D

A Bill to Amend the Federal Water Pollution Control Act by Establishing Standards for Synthetic Detergents.
W73-15150 6E

UNITED STATES-CANADIAN BOUNDARY WATERS TREATY
The Great Lakes Basin: Alternative Institutional Arrangements for Multi-Purpose Resources Management,
W73-15203 6E

UNIVERSITIES
Applied Water Chemistry at Washington State University,
W73-14787 9A

Directory of Water Resources Research Faculty at University of Minnesota and State and Private Colleges in Minnesota,
W73-14862 6A

UNSTEADY FLOW
Subcritical Kinematic Flow in a Stable Stream,
W73-14839 2E

UPPER KISSIMMEE RIVER BASIN (FLA)
River Basin Simulation as a Means of Determining Operating Policy for a Water Control System,
W73-14761 6B

UPPER MIDWEST REGION
Social/Environmental Systems for Regional Development Planning,
W73-14860 6B

URBAN DEVELOPMENT
Legal Constraints on Urban Water Systems,
W73-14905 3D

URBAN DRAINAGE
Testing of Methods for Determination of Urban Runoff,
W73-14835 4A

URBAN HYDROLOGY
Testing of Methods for Determination of Urban Runoff,
W73-14835 4A

Model for Calculating Floods in Urbanized Watersheds,
W73-15060 4C

Predictive Study on Urbanizing Effect of Drainage Basin on Flood Runoff,
W73-15061 4C

URBAN PLANNING
Water Planning Models in North Atlantic Study,
W73-14908 6D

URBAN RENEWAL
Water Quality and Mineral Solubilities in Surface and Ground Water; Oak Openings Community, Lucas Co., Ohio,
W73-14863 4B

URBAN RUNOFF
Variation of Urban Runoff Quality with Duration and Intensity of Storms--Phase II,
W73-14771 4C

Testing of Methods for Determination of Urban Runoff,
W73-14835 4A

An Inventory and Analysis of Existing Storm Drainage Systems in the Toledo Regional Area.
W73-15021 4A

URBANIZATION
Mathematical Modeling of Urban Water Management Strategies,
W73-14757 6B

Appraisal of the Water Resources of Charlotte County, Florida,
W73-14996 4B

Model for Calculating Floods in Urbanized Watersheds,
W73-15060 4C

USSR
Water Resources and Utilization (Voda--resursy i potrebleniye),
W73-14846 6B

Study of Groundwater Resources in the USSR (Izucheniye resursov podzemnykh vod SSSR),
W73-14849 4B

Problems of Reservoir Construction and Complex Use in the USSR (Problemy sozdaniya i kompleksnogo ispol'zovaniya vodokhranilishch v SSSR),
W73-14851 8A

Protection of Water Bodies in the USSR from Pollution (Okhrana vodoyemov v SSSR ot zagryazneniya),
W73-14853 5G

Prospects of Increasing Freshwater Resources in the USSR Through Desalting of Saline and Brackish Waters (Perspektivy uvelicheniya resursov presnykh vod na territorii SSSR za schet opresneniya solenykh i solonovatykh vod),
W73-14854 3A

International Cooperation in Hydrology (Mezhdunarodnoye sotrudnichestvo v oblasti gidrologii),
W73-14855 6E

Problems in the Study and Regulation of Anthropogenic Eutrophication of Water Bodies in the USSR (Zadachi izucheniya i regulirovaniya antropogennogo yevtrofirovaniya vodoyemov v SSR),
W73-15012 5C

Conference on the Hydrologic Cycle in Nature and Its Role in Formation of Freshwater Resources (Soveshchaniye po probleme 'Vlagooborot v prirode i yego rol' v formirovanii resursov presnykh vod'),
W73-15013 2A

Soviet National Committee of the International Association for Hydraulic Research (Sovetskiy natsional'nyy komitet Mezhdunarodnoy assotsiatsii po gidravlicheskim issledovaniyam),
W73-15014 2A

Fourth All-Union Hydrology Congress (IV Vsesoyuznyy gidrologicheskiy s'yezd),
W73-15015 2A

Twenty-Fifth Hydrochemistry Conference (XXV Gidrokhimicheskoye soveshchaniye),
W73-15016 2A

Sanitary Conditions of Wells on Highways of the Vinnitsa District and Measures to Improve their Water Quality, (In Russian),
W73-15276 5F

USSR (KAZAKHSTAN)
Rice Cultivation in Southern Kazakhstan Kzylkumsky Ridge, (In Russian),
W73-15283 3F

USSR (MARIISK)

Simulation Model for the Decision Between Dilution or Sewage Treatment During Droughts,
W73-15067 5G

UNIVERSITY OF SOUTH FLORIDA, ST. PETERSBURG. MARINE SCIENCE INST.
A Messenger-Operated Closing Trawl,
W73-15081 7B

UPPSALA UNIV. (SWEDEN). INST. OF LIMNOLOGY.
Oxygen Uptake of Bottom Sediments Studied in Situ and in the Laboratory,
W73-14822 5B

UTAH CENTER FOR WATER RESOURCES RESEARCH, LOGAN.
Eutrophication of Sheltered Bays in a Large Lake,
W73-14875 5C

UTAH STATE UNIV., LOGAN. DEPT. OF SOIL SCIENCE AND BIOMETEOROLOGY.
Some Observations on Soils-Microclimate Interactions,
W73-15292 2G

VETERANS ADMINISTRATION HOSPITAL, HOUSTON, TEX.
Biodegradation of Oleates,
W73-15127 5B

VIRGINIA INST. OF MARINE SCIENCE, GLOUCESTER POINT.
Instrumentation for Measurement of Beach Water-Table Fluctuations,
W73-14986 2F

The Water Table as a Response Variable of the System,
W73-14987 2F

Changes in Foreshore Sand Volume on a Tidal Beach: Role of Fluctuations in Water Table and Ocean Still-Water Level,
W73-14988 2F

Groundwater Flow in a Sandy Tidal Beach. 1. One-Dimensional Finite-Element Analysis,
W73-14989 2F

Effects of Brief Temperature Increases on Larvae of the American Oyster (Crassostrea Virginica),
W73-15124 5C

VIRGINIA INST. OF MARINE SCIENCES, GLOUCESTER POINT.
Investigation of the Water Table in a Tidal Beach, Final Report.
W73-14985 2F

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF BIOLOGY.
The Occurrence and Distribution of some Aquatic Phycomycetes on Ross Island and the Dry Valleys of Victoria Land, Antarctica,
W73-15120 5B

Comparison of Microhabitats of Macroscopic Subalpine Stream Algae,
W73-15125 5C

A Preliminary Report on the Use of Sequential Comparison Index to Evaluate Acid Mine Drainage on the Macrobenthos in a Pre-Impoundment Basin,
W73-15197 5C

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF FISHERIES AND WILDLIFE SCIENCES.
A Computer-Implemented Instructional Game for Evaluating Water Management Alternatives,
W73-14772 6B

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. WATER RESOURCES RESEARCH CENTER.
Meandering Rights for Contracted Water,
W73-15143 6E

VSESOYUZNYI NAUCHNO-ISSLEDOVATELSKII INSTITUT TSELLYULOZNO-BUMAZHOI PROMYSHLENNOSTI, LENINGRAD (USSR).
Rapid Method for Determination of the Activity and Concentration of Activated Sludge (Ekspress-metod opredeleniya aktivnosti ila i ego kontsentratsii),
W73-14945 5D

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.
- Water treatment plant waste pollution control at American Water Works Association.
- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.

Subject Fields

- 1 NATURE OF WATER
- 2 WATER CYCLE
- 3 WATER SUPPLY AUGMENTATION AND CONSERVATION
- 4 WATER QUANTITY MANAGEMENT AND CONTROL
- 5 WATER QUALITY MANAGEMENT AND PROTECTION
- 6 WATER RESOURCES PLANNING
- 7 RESOURCES DATA
- 8 ENGINEERING WORKS
- 9 MANPOWER, GRANTS, AND FACILITIES
- 10 SCIENTIFIC AND TECHNICAL INFORMATION
